CVS−RCS− HOW−TO document for Linux (Source Code Control System)

Al Dev (Alavoor Vasudevan) alavoor@yahoo.com

v8.0, 21 April 2000

This document is a "practical guide" to very quickly setup CVS/RCS source code control system. This document also has custom shell scripts which are wrappers on top of CVS. These scripts provide a easy user interface for CVS. The information in this document applies to Linux and as well as to all other flavors of Unix liks Solaris, HPUX, AIX, SCO, Sinix, BSD, SCO, etc..

1.Introduction

Source code control system is a MUST to manage the changes occuring to software project during development. Developer needs a complete history of changes to backtrack to previous versions in case of any problems. Since source code is the most vital component of any software project and software development takes a huge amount of time and money, it is very important to spend some time in ***safe−guarding*** the source code by using the source code control systems like CVS and RCS.

CVS (Concurrent Version Control System) is a powerful tool which allows concurrent development of software by multiple users. It uses RCS underneath and has application layer interface as a wrapper on top RCS.

CVS can record the history of your files (usually, but not always, source code). CVS only stores the differences between versions, instead of every version of every file you've ever created. CVS also keeps a log of who, when and why changes occurred, among other aspects.

CVS is very helpful for managing releases and controlling the concurrent editing of source files among multiple authors. Instead of providing version control for a collection of files in a single directory, CVS provides version control for a hierarchical collection of directories consisting of revision controlled files.

These directories and files can then be combined together to form a software release.

CVS can be used for storing "C", "C++", Java, Perl, HTML and other files.

2.Which one is for me? CVS or RCS

CVS actually uses RCS underneath. CVS is a lot more powerful tool and can control a complete source code tree. It is ***very strongly*** recommended that you use CVS, because you can greatly customize CVS with scripting languages like PERL, korn and bash shells. See the sample korn shell scripts at Shell Scripts .

Advantages of CVS

- CVS is de−centralised, user checks out files/directories from the repostitory and has his own seperate stable source directory tree.
- CVS can "STAMP" releases of entire project source tree.
- CVS can enable concurrent editing of files.
- CVS can be greatly customized to enable strong locking of files or enable concurrent editing of files using shell scripts or PERL.

Dis−Advantages of CVS

- Needs little more administration than RCS
- Very highly sophisticated and complex system. It is the "State of the Art" technology.
- Has large number of commands and command options. Hence steeper learning curve for beginners. The shell scripts at Shell Scripts can ease usage.

Advantages of RCS

- RCS is very simple to setup, less administration work.
- RCS is used in a centralized area where everyone works.
- RCS is useful for simple systems.
- Very strong locking of files − concurrency eliminated.

Downside of RCS

- Concurrent development by multiple developers is not possible due to file locking and a single working directory. Because of single working directory, code changes of files by multiple developers can cause failure of 'make' command.
- Cannot stamp releases of entire software project.

This document also has shell scripts which provide simple commands to check−out, check−in, commit files. See shell scripts at Shell Scripts

For RCS see the RCS mini−howto on the linux cdrom −

```
cd /mnt/cdrom/Redhat/RPMS
ls −l howto−6.0−*.noarch.rpm
rpm −qpl howto−6* | grep −i rcs
```

or visit

3.Setting up CVS

First you need to install the CVS package, on Redhat linux use

```
cd /mnt/cdrom/Redhat/RPMS
rpm −i rcs*.rpm
rpm −i cvs*.rpm
To see the list of files installed do −
rpm −qpl cvs*.rpm | less
```

and browse output using j,k, CTRL+f, CTRL+D, CTRL+B, CTRL+U or using arrow keys, page up/down keys. See 'man less'.

On other flavors of unix, you may need to download the RCS and CVS tar balls and follow README, INSTALL files to setup CVS. Visit http://www.cyclic.com and http://www.loria.fr/~molli/cvs−index.html

3.1 Environment variables

The following environment variables need to be setup in /etc/profile − default values required for all users. If not set in /etc/profile, than you should add these to your local profile file /.bash_profile.

```
export EDITOR=/bin/vi
export CVSROOT=/home/cvsroot
export CVSREAD=yes
```

Create a directory to store the source code repository and give read, write access to unix group/user.

```
export CVSROOT=/home/cvsroot
mkdir $CVSROOT
chmod o−rwx $CVSROOT
chmod ug+rwx $CVSROOT
```

To initialize the CVS and to put in source code files do −

```
cvs init

# Change directory is a must
cd $HOME/my_source_code_dir

# Must give vendor tag and revision tag
cvs import my_source_code_dir V1_0 R1_0
```

3.2 Migrate RCS to CVS

To migrate the existing RCS files to CVS, use the following script. Make sure that you installed korn shell package pdksh*.rpm from Linux contrib cdrom.

NOTE : ***Korn shell /bin/ksh is got by installing pdksh*.rpm from Linux contrib cdrom***

```
#!/bin/ksh

################################################################
# Program to Migrate the existing source code in RCS to CVS
#
# Needs the korn shell RPM package  pdksh*.rpm from Linux
# contrib cdrom
################################################################

#
# rcs2cvs − convert source tree from RCS to CVS
#

# project to convert
PROJECT='project'

# current RCS root
RCSROOT="$HOME/rcs"

if cd "$RCSROOT/$PROJECT"
then
        cd "$RCSROOT"
else
        echo >&2 "`basename "$0"`: can't change to RCS directory '$RCSROOT/$PROJECT'."
        exit 1
fi

# current CVS root
CVSROOT="$HOME/cvs"

# create new CVS directory for project 'project'
if mkdir "$CVSROOT/$PROJECT"
then
        :
else
        echo >&2 "`basename "$0"`: can't create CVS directory '$CVSROOT/$PROJECT'."
        exit 2
fi

# create CVS project tree from RCS tree
find "$PROJECT" −type d −name RCS −print |
while read RCS
do
        CVS="`dirname "$RCS"`"
        (if cd "$RCS"
        then
#               if find . −type f −name '*,v' −print | cpio −pdmv "$CVSROOT/$CVS"
                if find . −type f −print | cpio −pdmv "$CVSROOT/$CVS"
                then
                        :
                else
                        echo >&2 "`basename "$0"`: can't convert RCS subdirectory '$RCSROOT/$RCS'
                fi
        else
                echo >&2 "`basename "$0"`: can't change to RCS subdirectory '$RCSROOT/$RCS'."
        fi)
done
```

Now the RCS is migrated to CVS as 'project'. You can start using the CVS commands on module 'project'.

4.Shell Scripts

The following are wrappers around the basic CVS commands. The scripts are written for Korn shell since korn shell is always available on all flavors of unixes, but you can translate to bash or PERL if needed. You can customize these scrips to your taste. They are basically CVS commands but features are added to make it site specific. For example, sedit script provides locking so that users will know some−one is editing the file. Ofcourse users can directly use the CVS commands to by−pass these scripts. These scripts demonstrate as to how CVS can be customized to a great extent.

Copy these scripts to /usr/local/bin and this should be in the user's PATH environment.

1. **sget** [−r revision_number] <file/directory name> To get a file or entire directory from CVS in READ ONLY mode. Click sget
2. **sedit** [−r revision_number] <filename> To edit a file in order to make changes to code. This will lock the file so that nobody else can checkout. Ofcourse you can change the script to your requirement − make no locking, warning message or very strong locking. Click sedit
3. **scommit** [−r revision_number] <filename> To commit the changes you made to filename or entire directory. Upload your changes to CVS Click scommit
4. **supdate** <filename/directory> To update a filename or to update a entire directory by getting the latest files from CVS Click supdate
5. **sunlock** [−r revision_number] <filename> To unlock the file got by sedit. Will release the lock. Click sunlock
6. **slist** To see the list of files currently being edited by you. Does 'ls −l | grep | ...' command. Click slist
7. **sinfo** <filename/directory> To get the information of changes/revisions to a file Click sinfo
8. **slog** <filename> To get the history of changes/revisions to a file from CVS Click slog
9. **sdif** <filename>

   sdif −r rev1 −r rev2 <filename> To get the diff of your file with CVS. Click sdif

   NOTE: sdif has only one 'f' because there is already another unix command called 'sdiff'

10. **sadd** <filename> To add a new file to CVS repository Click sadd
11. **sdelete** <filename> To delete a file from CVS repository Click sdelete
12. **sfreeze** <revision name> <directory name> To freeze the code, that is make release of entire source tree. Click sfreeze
13. **saddtree** <revision name> <directory name> To add a directory tree to CVS. Click saddtree

    For example :

```
cd $HOME;
sfreeze REVISION_1_0  srctree
```

    This will freeze code with tag REVISION_1_0 so that you can later checkout the entire tree by using with revision name

****

4.1 sget

NOTE : ***Korn shell /bin/ksh is got by installing pdksh*.rpm from Linux contrib cdrom***

Save this file as text file and chmod a+rx on it.

```
#!/bin/ksh

# CVS program sget
# Program to check out the file from CVS read−only

cmdname=`basename $0`

Usage()
{
        print "\nUsage: $cmdname [−r revision_number/symbolic_tag_name] <file/directory name> "
        print "The options −r are optional "
        print "For example − "
        print " $cmdname −r 1.1 foo.cpp"
        print " $cmdname foo.cpp "
        print " $cmdname some_directory "
        print "Extract by symbolic revision tag like − "
        print " $cmdname −r REVISION_1 some_directory "
        print " "
        exit
}

5.CVS Documentation

At unix prompt type −

1. cvs −−help
2. cvs −−help−options
3. cvs −−help−commands
4. cvs −H checkout
5. cvs −H commit
6. man cvs
7. man tkcvs
8. Visit http://www.cyclic.com
9. Visit http://www.loria.fr/~molli/cvs−index.html

The tkcvs http://www.tkcvs.org is the Tcl/Tk GUI interface to CVS. It also has online help.

- cd $HOME/src/foo.cpp
- tkcvs
- Click on foo.cpp
- Click on 'Revision Log Icon' which is located next to 'spectacle' icon
- This will display the branch TREE in the window. Now RIGHT Mouse button click on the text '1.3' and LEFT Mouse button click on text '1.1'. Than click on "Diff" button. This will display 2 pane−window!!
- Click on "Next" button to step thru more diffs. Click on "Center" to center the text.

There is also a Windows 95 client for CVS, and is called WinCVS http://www.wincvs.org WinCVS can be used along with Samba − http://www.samba.org

The essential command are −

- cvs checkout <filename >
- cvs update <filename>
- cvs add <file, ..>
- cvs remove <file, ..>
- cvs commit <file>
- cvs status <filename>
- cvs log <filename>
- cvs diff −r1.4 −r1.5 <filename> This gives diff between version 1.4 and 1.5 on filename.

6.Emacs Editor

Emacs is a powerful editor and it supports CVS/RCS − especially for revision merging and comparing. Emacs main site is at http://www.emacs.org.

7.Problem Reporting System

Along with CVS, you may want to use Project Tracking system or Problem Reporting system. Every software project needs a Problem Reporint System where in bugs are tracked and assigned to various developers. Visit the site http://www.stonekeep.com for Project tracking system.

8.Other Formats of this Document

This document is published in 11 different formats namely − DVI, Postscript, Latex, Adobe Acrobat PDF, LyX, GNU−info, HTML, RTF(Rich Text Format), Plain−text, Unix man pages and SGML.

- You can get this HOWTO document as a single file tar ball in HTML, DVI, Postscript or SGML formats from − ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/other−formats/ or ftp://metalab.unc.edu/pub/Linux/docs/HOWTO/other−formats/
- Plain text format is in: ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO or ftp://metalab.unc.edu/pub/Linux/docs/HOWTO
- Translations to other languages like French, German, Spanish, Chinese, Japanese are in ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO or ftp://metalab.unc.edu/pub/Linux/docs/HOWTO Any help from you to translate to other languages is welcome.

The document is written using a tool called "SGML tool" which can be got from − http://www.xs4all.nl/~cg/sgmltools/ Compiling the source you will get the following commands like

- sgml2html cvs−rcs−howto.sgml (to generate html file)
- sgml2rtf cvs−rcs−howto.sgml (to generate RTF file)
- sgml2latex cvs−rcs−howto.sgml (to generate latex file)

This document is located at −

- http://sunsite.unc.edu/LDP/HOWTO/CVS−RCS−HOWTO.html

Also you can find this document at the following mirrors sites −

- http://www.caldera.com/LDP/HOWTO/CVS−RCS−HOWTO.html
- http://www.WGS.com/LDP/HOWTO/CVS−RCS−HOWTO.html
- http://www.cc.gatech.edu/linux/LDP/HOWTO/CVS−RCS−HOWTO.html
- http://www.redhat.com/linux−info/ldp/HOWTO/CVS−RCS−HOWTO.html
- Other mirror sites near you (network−address−wise) can be found at http://sunsite.unc.edu/LDP/hmirrors.html select a site and go to directory /LDP/HOWTO/CVS−RCS−HOWTO.html

In order to view the document in dvi format, use the xdvi program. The xdvi program is located in tetex−xdvi*.rpm package in Redhat Linux which can be located through ControlPanel | Applications | Publishing | TeX menu buttons.

```
To read dvi document give the command −
        xdvi −geometry 80x90 howto.dvi
And resize the window with mouse. See man page on xdvi.
To navigate use Arrow keys, Page Up, Page Down keys, also
you can use 'f', 'd', 'u', 'c', 'l', 'r', 'p', 'n' letter
keys to move up, down, center, next page, previous page etc.
To turn off expert menu press 'x'.
```

You can read postscript file using the program 'gv' (ghostview) or 'ghostscript'. The ghostscript program is in ghostscript*.rpm package and gv program is in gv*.rpm package in Redhat Linux which can be located through ControlPanel | Applications | Graphics menu buttons. The gv program is much more user friendly than ghostscript. Ghostscript and gv are also available on other platforms like OS/2, Windows 95 and NT.

- Get ghostscript for Windows 95, OS/2, and for all OSes from http://www.cs.wisc.edu/~ghost

```
To read postscript document give the command −
        gv howto.ps

To use ghostscript give −
        ghostscript howto.ps
```

You can read HTML format document using Netscape Navigator, Microsoft Internet explorer, Redhat Baron Web browser or any other web browsers.

You can read the latex, LyX output using LyX a "X−Windows" front end to latex.
