Database−SQL−RDBMS HOW−TO document for Linux (PostgreSQL Object Relational Database System)

Al Dev (Alavoor Vasudevan) alavoor@yahoo.com

v21.0, 14 May 2000

This document is a "practical guide" to very quickly setup a SQL Database engine and front end tools on a Unix system. It also discusses the International standard language ANSI/ISO SQL and reviews the merits/advantages of the SQL database engine developed by the world−wide internet in an "open development" environment. It is about HOW−TO setup a next generation Object Relational SQL Database "PostgreSQL" on Unix system which can be used as a Application Database Server or as a Web Database Server. PostgreSQL attempts to implement current and future International ISO/ANSI SQL standards. This document also gives information on the database interface programs like Front End GUIs, RAD tools (Rapid Application Development), ODBC, JDBC drivers, "C", "C++", Java, Perl programming interfaces and Web Database Tools. Information given here applies to all Unix/Windows NT platforms and to all other SQL databases. It will be very useful for people who are new to Databases, SQL language and PostgreSQL. This document also has SQL tutorial, SQL syntax which would be very helpful for beginners. Experienced people will find this document as a useful reference guide. For students, the information given here will enable them to get the source code for PostgreSQL relational database system, from which they can learn as to how a RDBMS SQL database engine is created.

1.Introduction

The purpose of this document is to provide comprehensive list of pointers/URLs to quickly setup PostgreSQL and also to advocate the benefits of Open Source Code system like PostgreSQL, Linux.

Each and every computer system in the world needs a database to store/retrieve the information. The primary reason you use the computer is to store, retrieve and process information and do all these very quickly, thereby saving you time. At the same time, the system must be simple, robust, fast, reliable, economical and very easy to use. Database is the most **VITAL SYSTEM** as it stores mission critical information of every company in this world. Each and every industry in this world needs a database system. Industries like

telecom, automobile, banks, airlines, etc.. will not function efficiently without a database system. The most popular database systems are based on the International Standard Organisation (ISO) SQL specifications and ANSI SQL (American) standards. The current specifications widely used in the industry are ISO/ANSI SQL 1992. Upcoming standard is the SQL 1998/99 which is also called SQL−3 is still under development. Popular database like Oracle, Sybase and Informix systems are based on these standards or are trying to implement these standards.

Without a standard like ANSI/ISO SQL, it would be very difficult for the customer to develop a application once and run on all the database systems. End user wants to develop an application ONCE using ISO SQL, ODBC, JDBC and deploy on all variety of database systems in the world.

The world's most popular FREE Database which implements some of the ISO SQL, ANSI SQL/98, SQL/92 and ANSI SQL/89 RDBMS is PostgreSQL. PostgreSQL is next generation Object relational database and is targeting on full compliance of SQL standards like ISO/ANSI SQL. PostgreSQL is the only free RDBMS in the world which supports Object databases and SQL. This document will tell you how−to install the database, how to set up the Web database, application database, front end GUIs and interface programs. It is strongly advised that you MUST write your database applications 100 % compliant to standards of ISO/ANSI SQL, ODBC, JDBC so that your application is portable across multiple databases like PostgreSQL, Oracle, Sybase, Informix etc.

You get the highest quality, and lot many features with PostgreSQL as it follows 'Open Source Code development model'. Open Source Code model is the one where the complete source code is given to you and the development takes place on the internet by a extremely vast network of human brains. Future trend shows that most of the software development will take place on the so called "Information Super−Highway" which spans the whole globe. In the coming years, internet growth will be explosive which will further fuel rapid adoption of PostgreSQL by the industry.

By applying the principles of statistics, mathematics and science to software quality, you get the best quality of software only in a 'Open Source Code System' like PostgreSQL, wherein the source code is open to a very vast number of human brains inter−connected by the information super−highway. Greater the number of human brains working, the better will be the quality of software. Open Source Code model will also prevent **RE−INVENTION OF WHEELS**, eliminates **DUPLICATION OF WORK** and will be very economical, saves time in distribution and follows the modern economic laws of optimizing the national and global resources. Once a software work is done by others, then you **DO NOT** need to re−do that again. You will not be wasting your valuable time on something which had already been **WELL DONE**. Your time is extremely precious and it must be utilized efficiently, because you have only 8 hours a day for doing work. As we will be entering the 21st century, there will be a change in the way that you get software for your use. Everybody will give first preference for the open source softwares like PostgreSQL, Linux.

If you buy binaries, you will not get any equity and ownership of source code. Source code is a very valuable asset and binaries have no value. Buying software *may* become a thing of the past. You only need to buy good hardware, it is worth spending money on the hardware and get the software from internet. Important point is that it is the computer hardware which is **doing bulk of the work**. Hardware is the real work horse and software is just driving it. Computer hardware is so much more complex that only 6 nations in the world so far have demonstrated the capability of designing and manufacturing computer chips/hardware. Design and manufacturing of computer chips is a advanced technology. It is a very complex process, capital intensive, requires large investments in plant and production machines which deal with 0.18 micron (even smaller than 0.18) technology. On a single small silicon chip millions of transistors/circuits are densely packed. Companies like Applied Material, AMD, Intel, Cyrix, Hitachi, IBM and others spent significant number of man−years to master the high−technology like Chip Design, Micro−electronics and Nano−electronics. Micro means (one−millionth of meter 10^−6), Nano means (one−billionth of meter

10^−9). Current technology uses micro−electronics of about 0.35 micron using aluminum as conductors and 0.25 micron sizes using copper as conductors of electrons. In near future the technology of 0.10 micron with copper and even nano−electronics will be used to make computer chips. Aluminum conductors will be phased out by copper on computer chips, as copper is a better conductor of electrons. In photolithography process extreme ultraviolet, X−ray or electron−beam techniques will be used to etch circuits for feature size less than 0.15 micron. In about 20 years from now, silicon chips will be phased out by molecular computers and bio chips which will be billions of times faster than silicon chips. Molecules are a group of atoms. And atoms are tiny particles which makes up everything that you see in this world. Molecular computers will use the molecules of matter as ultra−fast electronic on/off switches. When the switch is ON it indicates 1, and when it is OFF it indicates 0. All the computer programs in this world are based on binary (numbers 1 and 0). Table below shows the progress and future advancement trends of computer chips.

Advancement of chip capabilities in future

Item/Year	1997	1999	2001	2003	2012	2020
Feature size(micron)	0.25	0.18	0.15	0.13	0.05	< 0.00001
Wafer size(mm)	200	300	300	300	450	Mol/Bio
Min Operating Voltage	1.8−2.5	1.5−1.8	1.2−1.5	1.2−1.5	0.5−0.6	< 0.001
Max power dissipation	70	90	110	130	175	600
On−chip frequencey (MHz)	750	1,250	1,500	2,100	10,000	> 50,000
DRAM capacity	256 MB	1 GB	2 GB	4 GB	256 GB	> 1000GB

As you can see, it is hardware that is high technology and important and software is labor intensive but is a less difficult technology.

On other hand, each and every country in the world develops/makes software. In fact, any person in this world with a small low−cost PC can write software.

Databases like Oracle, Informix, Sybase, IBM DB2 (Unix) are written using the "C" language and binaries are created by compiling the source code and then they are shipped out to customers. Oracle, Sybase, Informix databases are 100 % "C" programs!!

Since a lot of work had been done on PostgreSQL for the past 14 years, it does not make sense to re−create from scratch another database system which satisfies ANSI/ISO SQL. It will be a great advantage to take the existing code and add missing features or enhancements to PostgreSQL and start using it immediately.

Prediction is that demand for "Internet products" like PostgreSQL will grow exponentially as it is capable of maintaining a high quality, low cost, extremely large user−base and developer−base. Those nations which do not use the 'Internet products' will be seriously missing "World−wide Internet Revolution" and will be left far behind other countries. The reason is "Internet" itself is the world's **LARGEST** "software company" and is a large software "power house"!

2.Laws of Physics apply to Software!

In this chapter, it will be shown how science plays a important role in the creation of various objects like software, this universe, mass, atoms, energy and even yourself! This chapter also shows why knowledge of science is very important before you start using the products of science.

The golden rule is − *"You MUST not use a product without understanding how it is created!!"* This rule applies to everything − database sytems, computer system, operating system, this universe and even your own human body! It means that you should have complete source code and information about the system. It is important to understand how human body and atoms inside human body works since humans are creating PostgreSQL, MS Windows95 etc..

Creation is a very important step. Persons who are using the objects of science must know how it is created. This applies to even computer systems and PostgreSQL. A majority of people do not have knowledge of science and hence do not know how systems like MS Windows NT/95, Oracle, human body and this universe are created. A vast majority of people do not know what made the universe and MS Windows 95/NT and what is inside it. Complex systems are built from very simple basic building blocks like − millions of universes are created, each universe in turn has millions of super−clusters, each super−cluster has millions of galaxies, each galaxy has millions of stars, some stars system have many planets, each planet in turn is made up billions of atoms.*(In the history of this world,* ***only one universe was created by a man*** *in ancient India eons ago, but no other case had been reported in the modern history. Creating a universe is a much more advanced technology and is more advanced than the atomic bomb which was dropped on Hiroshima and Nagasaki causing* ***horrible destruction****). Modern nuclear weapons are so tiny and powerful that if such a single nuclear bomb is dropped then it can completely vaporise the planet earth! But there are also weapons which will completely* ***NULLIFY and NEUTRALISE*** *all the nuclear weapons in the world!! Total variety of weapons are infinity!*. Software like MS Windows 95 is created simply by "C" and assembler language programs which simply uses 1 and 0 and ***universes like ours are created simply by dashing TWO dissimilar but proper of combination of tiny atomic particles of other dimensions.*** A human body is created by dashing two dissimilar but proper combination of tiny cells!! Humans inherited the properties of this universe. The universe you are currently living in was NOT there − all the atoms inside the universe was not there and not even TIME was existing!! Baby universe was born during big bang and started expanding and kept growing. Even today the universe is still expanding!! A person from another universe by name **'Brahma'** created this universe you are currently living in. It is indeed possible for man to create a new universe. Total number of universes that can be created is **INFINITY** and similarly total number of operating systems that can be created is also **infinity**!! Infinite number universes and infinite variety of multi−dimensional atoms collapse down into few *primary−dimensional−universe*.

The laws of science and statistics favour the open−source code system like PostgreSQL and Linux. As the internet speed is increasing everyday, and internet is becoming more and MORE reliable, the open−source code system will gain very rapid momentum. And, if rules of statistics and laws of physics are correct, awareness of science grows and when **IGNORANT** people start learning science then the closed source−code systems will eventually vanish from this planet.

Developing a project like PostgreSQL requires resources like energy and time, hence PostgreSQL is a product of energy and time. Since energy and time can be explained only by science, there is a direct co−relation between physics and software projects like PostgreSQL, Linux. Laws of science (Physics) applies everywhere and at all the times, to anything that you do, even while you are developing the software projects.

Physics is in action even while you are talking (sound waves), walking (friction between ground and your feet), reading a book or writing software. Every science in this world has a deep root in mathematics,

including PostgreSQL. PostgreSQL uses 'Modern Algebra' which is a tiny branch of mathematics. Modern algebra deals with 'Set Theory', 'Relational Algebra', science of Groups, Rings, Collections, Sets, Unions, Intersections, Exclusions, Domains, Lists, etc...

The software like PostgreSQL is existing today because of the energy and time. And mass and energy are ONE and the **SAME** entity. The fact that mass and energy are same was unknown to people 100 years ago! And even **today** it is unknown to world population that internet is the largest software "power house" and the largest "software company" in the world!

Cells in the human brains consume energy while processing (creating software), by converting the chemical energy from food into electrical and heat energy. Even while you are reading this paragraph, the cells in your brain are burning out the fuel and are using tiny amounts of energy. All of these implies that human brain is a thermodynamic heat engine. Because human brain is a thermodynamic engine, the laws of thermodynamics applies to brain and hence thermodynamics has indirect effects on software like PostgreSQL.

There can be infinite number of colors, computer langauages, computer chip designs and theories but there CANNOT be ONE SINGLE PERFECT color, computer language, design or system! What you can have is only a NEAR PERFECT color(wavelength), system, database, or theory! **Nature is like a *KALIEDOSCOPE*** − there are infinite number of dimensions, infinite variety particles of other dimensions but they all combine into very few primary dimensions and vice−versa.

By combining the energies of millions of people around the world via internet it is possible to achieve a **NEAR PERFECT** system (including a database software system). Individually, the energy of each person will be minute, but by networking a large number of people, the total energy will be huge which can be focused on a project to generate a near perfect system.

The energy is measured in Joules, kiloJoules or kilograms of mass, and time is measured in seconds or hours. And power is energy divided by time and is measured in Watts or kiloWatts .

```
        Energy of each person = y Joules
or in terms of mass
        Energy of each person = y grams
The conversion factor between mass and energy is E = m * c * c
where 'c' is the speed of light and 'm' is the mass.
        Time = 8 hours (This is constant since each person has only 8 hours a day)
        Power = Energy / Time
                  = (y / (8 * 60 * 60) ) Watts
        Total Power of the world = n * (y / (8 * 60 * 60) ) Watts
where n = number of persons working on the project.
```

From the above equation it is clear that increasing the 'n' will greatly improve the quality of product.

It is very clear that internet can network a vast number of people, which implies internet has a lot of energy and time which can produce much higher quality software products in much shorter time as compared to commercial companies. Even very big companies like Microsoft and IBM cannot overpower and overrule the laws of Physics but will eventually **SURRENDER UNTO** laws of science!

Conclusion is − because of laws of science, 'open source code' system like PostgreSQL, Linux will prevail and will be always much better than 'closed source code' system and it is possible to prove this statement scientifically. Man should not waste time creating too many duplicate software products.

3.What is PostgreSQL ?

PostgreSQL is a free database, complete source code is given to you and is a Object−Relational Database System targetting on ANSI ISO/SQL 1998, 92 and runs on diverse hardware platforms and Operating systems. The ultimate objective and the final goal of PostgreSQL is to become 100 % compliant to ANSI/ISO SQL and also to become the number ONE open generic Database in the world.

Informix Universal server (released 1997) is based on earlier version of PostgreSQL because Informix bought Illustra Inc. and integrated with Informix. Illustra database was based on Postgres (earlier version of PostgreSQL).

PostgreSQL is an enhancement of the POSTGRES database management system, a next−generation DBMS research prototype. While PostgreSQL retains the powerful data model and rich data types of POSTGRES, it replaces the PostQuel query language with an extended subset of SQL.

PostgreSQL development is being performed by a team of Internet developers who all subscribe to the PostgreSQL development mailing list. The current coordinator is Marc G. Fournier

- scrappy@postgreSQL.org

This team is now responsible for all current and future development of PostgreSQL. Ofcourse, the database customer himself is the developer of PostgreSQL! The development load is distributed among a very large number of database end−users on internet.

The authors of PostgreSQL 1.01 were Andrew Yu and Jolly Chen. Many others have contributed to the porting, testing, debugging and enhancement of the code. The original Postgres code, from which PostgreSQL is derived, was the effort of many graduate students, undergraduate students, and staff programmers working under the direction of Professor Michael Stonebraker at the University of California, Berkeley.

The original name of the software at Berkeley was Postgres. When SQL functionality was added in 1995, its name was changed to Postgres95. The name was changed at the end of 1996 to PostgreSQL.

Millions of PostgreSQL is installed as Database servers, Web database servers and Application data servers. It is very sophisticated object relational database system (ORDBMS).

PostgreSQL runs on Solaris, SunOS, HPUX, AIX, Linux, Irix, Digital Unix, BSDi,NetBSD, FreeBSD, SCO unix, NEXTSTEP, Unixware and all and every flavor of Unix. Port to Windows NT is done using Cygnus cygwin32 package.

- Title: PostgreSQL SQL RDBMS Database (Object Relational Database Management System)
- Current Version: 6.5.3
- Age: PostgreSQL is 14 years old. Developed since 1985
- Authors: Developed by millions/universities/companies on internet for the past 14 YEARS

PostgreSQL and related items in this document are subject to the COPYRIGHT from University of California, Berkeley.

4.Where to get it ?

You can buy Redhat Linux CDROM, Debian Linux CDROM or Slackware Linux CDROM which already contains the PostgreSQL in package form (both source code and binaries) from :

- Linux System Labs Web site: http://www.lsl.com/ (7 U.S. dollars)
- Cheap Bytes Inc Web site: http://www.cheapbytes.com/ (7 U.S. dollars)
- Debian Main Web site : http://www.debian.org/vendors.html

PostgreSQL organisation is also selling 'PostgreSQL CDROM' which contains the complete source code and binaries for many Unix operating systems as well as full documentation.

- PostgreSQL CDROM from main Web site at : http://www.postgresql.org 30 (U.S. dollars)

Binaries only distribution of PostgreSQL:

- The maintainer of PostgreSQL RPMs is Lamar Owen and is at lamar.owen@wgcr.org
- PostgreSQL source RPM and binaries RPM http://www.ramifordistat.net/postgres
- PostgreSQL source RPM and binaries RPM http://www.postgresql.org Click on "Latest News" and click on Redhat RPMs.
- PostgreSQL source RPM and binaries RPM http://www.redhat.com/pub/contrib/i386/ and ftp site is at ftp://ftp.redhat.com/pub/contrib/i386/
- Binaries site for Solaris, HPUX, AIX, IRIX, Linux : ftp://ftp.postgresql.org/pub/bindist

WWW Web sites:

- Primary Web site: http://www.postgresql.org/
- Secondary Web site: http://logical.thought.net/postgres95/
- http://www.itm.tu−clausthal.de/mirrors/postgres95/

- ftp://sunsite.auc.dk/pub/databases/postgresql
- ftp://ftp.task.gda.pl/pub/software/postgresql
- ftp://xenium.pdi.net/pub/PostgreSQL

PostgreSQL source code is also available at all the mirror sites of sunsite unc (total of about 1000 sites around the globe). It is inside the Red Hat Linux distribution in /pub/contrib/i386/postgresql.rpm file.

- For list of mirror sites go to ftp://sunsite.unc.edu

5.PostgreSQL Quick−Installation Instructions

This chapter will help you to install and run the database very quickly in less than 5 minutes.

5.1 Install and Test

Quick Steps to Install, Test, Verify and run PostgreSQL Login as root.

```
# cd /mnt/cdrom/RedHat/RPMS
# man rpm
# ls postgre*.rpm
# rpm −qpl postgre*.rpm | less (to see list of files)
# rpm −qpi postgre*.rpm (to see info of package)
# cat /etc/passwd | grep postgres
```

Note: If you see a 'postgres' user, you may need to backup and clean up the postgres home directory postgres and delete the unix user 'postgres' or rename the unix user 'postgres' to something like 'postgres2'. Install must be "clean slate"

```
# rpm −i postgre*.rpm (Must install all packages clients, devel, data
         and main for pgaccess to work )
# man chkconfig
# chkconfig −−add postgresql  (to start pg during booting)
# /etc/rc.d/init.d/postgresql start  (to start up postgres)
# man xhost
# xhost +  (To give display access for pgaccess)
# su − postgres
bash$ man createdb
bash$ createdb mydatabase
bash$ man psql
bash$ psql mydatabase
..... in psql press up/down arrow keys for history line editing or \s

bash$ export DISPLAY=<hostname>:0.0
bash$ man pgaccess
bash$ pgaccess mydatabase
```

Now you can start **rapidly BANGING away** SQL commands at psql or pgaccess !!

```
bash$ cd /usr/doc/postgresql*
```

Here read all the FAQs, User, Programmer, Admin guides and tutorials.

5.2 PostgreSQL RPMs

See also *"Installation Steps"* from http://www.ramifordistat.net/postgres

The maintainer of PostgreSQL RPMs is Lamar Owen and is at lamar.owen@wgcr.org More details about PostgreSQL is at http://www.postgresql.org

5.3 Maximum RPM

Familiarize with RedHat RPM package manager to manage the PostgreSQL installations. Download the 'Maximum RPM' textbook from http://www.RPM.org look for the filename maximum−rpm.ps.gz And read it on linux using the gv command −

```
# gv maximum−rpm.ps.gz
```

There is also rpm2deb which converts the RPM packages to Debian linux packages.

5.4 Examples RPM

Examples are needed to do testing of various interfaces to PostgreSQL. Install the postgresql examples directory from −

- Linux cdrom − postgresql−*examples.rpm
- postgresql−*examples.rpm from http://www.aldev.8m.com or http://www.aldev.webjump.com
- PostgreSQL source code tree postgresql*.src.rpm and look for examples, testing or tutorial directories

5.5 Testing PyGreSQL − Python interface

Install examples package, see Examples RPM and then do −

```
bash$ cd /usr/lib/pgsql/python
bash$ createdb thilo
bash$ psql thilo
thilo=> create table test (aa char(30), bb char(30) );
bash$ /usr/bin/python
>>> import _pg
>>> db = _pg.connect('thilo', 'localhost')
>>> db.query("INSERT INTO test VALUES ('ping', 'pong')")
>>> db.query("SELECT * FROM test")
eins|zwei
----+----
ping|pong
(1 row)
>>>CTRL+D
bash$
..... Seems to work − now install it properly
bash$ su − root
# cp /usr/lib/pgsql/python/_pg.so /usr/lib/python1.5/lib−dynload
```

5.6 Testing Perl − Perl interface

Install examples package, see Examples RPM and then do −

```
bash$ cd /usr/doc/postgresql−6.5.3/examples/perl5
bash$ perl ./example.pl
```

Note: If the above command does not work then do this. Gloabl var @INC should include the Pg.pm module in directory site_perl hence use −I option below

```
bash$ perl −I/usr/lib/perl5/site_perl/5.005/i386−linux−thread ./example.pl
```

.... You ran the perl which is accessing PostgreSQL database!!

Read the example.pl file for using perl interface.

5.7 Testing libpq, libpq++ interfaces

Install examples package, see Examples RPM and then do −

```
bash$ su root   −−> to change ownership of examples
# chown −R postgres /usr/doc/postgresql−6.5.3/examples
# exit

bash$ cd /usr/doc/postgresql−6.5.3/examples/libpq
bash$ gcc testlibpq.c −I/usr/include/pgsql −lpq
bash$ export PATH=$PATH:.
bash$ a.out

bash$ cd /usr/doc/postgresql−6.5.3/examples/libpq++
bash$ g++ testlibpq0.cc −I/usr/include/pgsql −I/usr/include/pgsql/libpq++
−lpq++ −lpq −lcrypt
bash$ ./a.out  (Note: Ignore Error messages if you get any − as below)
> create table foo (aa int, bb char(4));
No tuples returned...
status = 1
Error returned: fe_setauthsvc: invalid name: , ignoring...
> insert into foo values ('4535', 'vasu');
No tuples returned...
status = 1
Error returned: fe_setauthsvc: invalid name: , ignoring...
> select * from foo;
aa   |bb   |
−−−−−|−−−−−|
4535 |vasu |
Query returned 1 row.
>
>CTRL+D
bash$
```

.... You ran direct C/C++ interfaces to PostgreSQL database!!

5.8 Testing Java interfaces

Install examples package, see Examples RPM and also install the following −

- Get JDK jdk−*glibc*.rpm from ftp://ftp.redhat.com/pub/contrib/i386 or from http://www.blackdown.org
- Get postgresql−jdbc−*.rpm ftp://ftp.redhat.com/pub/contrib/i386

```
bash$ cd /usr/doc/postgresql−6.5.3/examples/jdbc
bash$ echo $CLASSPATH
 −−> Should show  CLASSPATH=/usr/lib/jdk−x.x.x/lib/classes.zip
where x.x.x is proper version numbers.
bash$ export CLASSPATH=$CLASSPATH:.:/usr/lib/pgsql/jdbc6.5−1.2.jar
Edit all psql.java file  and comment out the 'package' line.
bash$ javac psql.java
bash$ java psql jdbc:postgresql:template1 postgres < password>[1] select * from pg_tables;
tablename       tableowner      hasindexes      hasrules
pg_type postgres        true    false   false
pg_attribute    postgres        true    false   false
[2]
CTRL+C
bash$
```

.... You ran direct Java interfaces to PostgreSQL database!

5.9 Testing ecpg interfaces

Install examples package, see Examples RPM and then do −

```
bash$ cd /usr/doc/postgresql−6.5.3/examples/ecpg
bash$ ecpg test1.pgc −I/usr/include/pgsql
bash$ cc test1.c −I/usr/include/pgsql −lecpg −lpq −lcrypt
bash$ createdb mm
bash$ ./a.out
```

.... You ran Embedded "C"−SQL to PostgreSQL database!

5.10 Testing SQL examples − User defined types and functions

Install examples package, see Examples RPM and then do −

```
bash$ cd /usr/doc/postgresql−6.5.3/examples/sql
Under−development..
```

5.11 Testing Tcl/Tk interfaces

Example of Tcl/Tk interfaces is pgaccess program. Read the file /usr/bin/pgaccess using a editor −

```
bash$ view /usr/bin/pgaccess
bash$ export DISPLAY=<hostname of your machine>:0.0
bash$ createdb mydb
bash$ pgaccess mydb
```

5.12 Testing ODBC interfaces

1. Get the win32 pgsql odbc driver from http://www.insightdist.com/psqlodbc/
2. See also /usr/lib/libpsqlodbc.a

5.13 Testing MPSQL Motif−worksheet interfaces

Get the RPMs from http://www.mutinybaysoftware.com

5.14 Verification

To verify the top quality of PostgreSQL, run the Regression test package :− Login as root −

```
# rpm −i postgresql*test.rpm
And see README file or install the source code tree which has regress directory
# rpm −i postgresql*.src.rpm
# cd /usr/src/redhat/SPECS
# more postgresql*.spec   (to see what system RPM packages you need to
install)
# rpm −bp postgresql*.spec  (.. this will prep the package)

Regression test needs the Makefiles and some header files like *fmgr*.h
which can be built by −
# rpm −−short−circuit −bc postgresql*.spec ( .. use short circuit to
bypass!)
Abort the build by CTRL+C, when you see 'make −C common  SUBSYS.o'
By this time configure is successful and all makefiles and headers
are created. You do not need to proceed any further
# cd /usr/src/redhat/BUILD
# chown −R postgres postgresql*
# su − postgres
bash$ cd /usr/src/redhat/BUILD/postgresql−6.5.3/src/test/regress
bash$ more README
bash$ make clean; make all runtest
bash$ more regress.out
```

5.15 Emergency Bug fixes

Sometimes emergency bug fix patches are released after the GA release of PostgreSQL. You can apply these optional patches depending upon the needs of your application. Follow these steps to apply the patches − Change directory to postgresql source directory

```
# rpm −i postgresql*.src.rpm
# cd /usr/src/postgresql6.5.3
# man patch
# patch −p0 < patchfile
# make clean
# make
```

The patch files are located in

- PostgreSQL patches : ftp://ftp.postgresql.org/pub/patches

6.PostgreSQL Supports Extremely Large Databases greater than 200 Gig

Performance of 32−bit cpu machines will decline rapidly when the database size exceeds 5 GigaByte. You can run 30 gig database on 32−bit cpu but the performance will be degraded. Machines with 32−bit cpu imposes a limitation of 2 GB on RAM, 2 GB on file system sizes and other limitations on the operating system. Use the special filesystems for linux made by SGI, IBM or HP or ext3−fs to support file−sizes greater than 2 GB on 32−bit linux machines.

For extremely large databases, it is strongly advised to use 64−bit machines like Digital Alpha cpu, Sun Ultra−sparc 64−bit cpu, Silicon graphics 64−bit cpu, Intel Merced IA−64 cpu, HPUX 64bit machines or IBM 64−bit machines. Compile PostgreSQL under 64−bit cpu and it can support huge databases and large queries. Performance of PostgreSQL for queries on large tables and databases will be several times faster than PostgreSQL on 32−bit cpu machines. Advantage of 64−bit machines are that you get very large memory addressing space and the operating system can support very large file−systems, provide better performance with large databases, support much larger memory (RAM), have more capabilities etc..

7.How can I trust PostgreSQL ? Regression Test Package builds customer confidence

Thanks to *"Laws of Physics"*, it is possible to **SCIENTIFICALLY** verify whether PostgreSQL is working as per ISO/ANSI SQL specifications. To validate PostgreSQL, regression test package (src/test/regress) is included in the distribution. Regression test package will verify the standard SQL operations as well as the extensibility capabilities of PostgreSQL. The test package already contains hundreds of SQL test programs.

You should use the computer's high−speed power to validate the PostgreSQL, instead of using human brain power. Computers can carry out software regression tests millions or even billions of times faster than humans can. Modern computers can run billions of SQL tests in a very short time. In the near future the speed

of computer will be several zillion times faster than human brain! Hence, it makes sense to use the power of computer to validate the software.

You can add more tests just in case you need to, and can upload to the primary PostgreSQL web site if you feel that it will be useful to others on internet. Regression test package helps build customer confidence and trust in PostgreSQL and facilitates rapid deployment of PostgreSQL on production systems.

Regression test package can be taken as a **"VERY SOLID"** technical document mutually agreed upon between the developers and end−users. PostgreSQL developers extensively use the regression test package during development period and also before releasing the software to public to ensure good quality.

Capablilities of PostgreSQL are directly reflected by the regression test package. If a functionality, syntax or feature exists in the regression test package then it is supported, and all others which are NOT listed in the package MAY not be supported by PostgreSQL!! You may need to verify those and add it to regression test package.

8.GUI FrontEnd Tool for PostgreSQL (Graphical User Interface)

Web browser will be the most popular GUI front−end in the future. A major portion of code should be written in Web server scripting (and compiling) language PHP+Zend compiler, HTML, DHTML and with little bit of JavaScript and Java−Applets on web−client side. It is recommended that you migrate all of your "legacy" Windows 95/NT applications to PHP + HTML + DHTML and Zend compiler. **PHP** is extremely powerful as it combines the power of Perl, Java, C++, Javascript into one single language and it runs on all OSes − unixes and Windows NT/95.

The best tools in the order of preference are −

- PHP script and Zend compiler at PHP+Zend compiler
- X−Designer supports C++, Java and MFC http://www.ist.co.uk/xd
- Qt for Windows95 and Unix at http://www.troll.no and ftp://ftp.troll.no
- Code Crusader is on linux cdrom, freeware based on MetroWorks Code Warrior http://www.kaze.stetson.edu/cdevel/code_crusader/about.html
- Code Warrior from MetroWorks http://www.metrowerks.com
- GNU Prof C++ IDE from (Redhat) Cygnus http://www.cygnus.com
- Borland C++ Builder for Linux http://www.inprise.com
- Borland Java JBuilder for Linux http://www.inprise.com

Language choices in the order of preference are −

1. PHP Web server scripting, HTML, DHTML with Javascrpt client scripting and Java−Applets.
2. Perl scripting language using Perl−Qt or Perl−Tk Perl Database Interface
3. Omnipresent and Omnipotent language C++ (GNU g++):
    - ♦ Fast CGI(written in GNU C++) with Javascript/Java−Applets as Web−GUI−frontend.
    - ♦ GNU C++ and QtEZ or QT
    - ♦ GNU C++ with Lesstiff or Motif.
4. Java but its programs run very slow and has license fees. C++ is **20 times faster** than Java!!

There are other tools available − PostgreSQL has Tcl/Tk interface library in the distribution called 'pgTcl'. There is a IDE (integrated development environment) for Tcl/Tk called SpecTcl.

- Lesstiff Motif tool ftp://ftp.redhat.com/pub/contrib/i386/lesstiff*.rpm
- Vibe Java/C++ is at http://www.LinuxMall.com/products/00487.html
- JccWarrior ftp://ftp.redhat.com/pub/contrib/i386/jcc*.rpm
- Tcl/Tk http://www.scriptics.com

- ftp://ftp.sunlabs.com/pub/tcl/tcl8.0a2.tar.Z
- Java FreeBuilder ftp://ftp.redhat.com/pub/contrib/i386/free*.rpm
- SpecTCL ftp://ftp.redhat.com/pub/contrib/i386/spec*.rpm
- Java RAD Tool for PostgreSQL Kanchenjunga http://www.man.ac.uk/~whaley/kj/kanch.html
- Applixware Tool http://www.redhat.com
- XWPE X Windows Programming Environment http://www.rpi.edu/~payned/xwpe/ftp://ftp.redhat.com/pub/contrib/i386/xwpe*.rpm
- XWB X Windows Work Bench ftp://ftp.redhat.com/pub/contrib/i386/xwb*.rpm
- NEdit ftp://ftp.redhat.com/pub/contrib/i386/nedit*.rpm

You can also use Borland C++ Builder, Delphi, Borland JBuilder, PowerBuilder on Windows95 connecting to PostgreSQL on unix box through ODBC/JDBC drivers.

9.Interface Drivers for PostgreSQL

9.1 ODBC Drivers for PostgreSQL

ODBC stands for 'Open DataBase Connectivity' established by Microsoft, is a popular standard for accessing information from various databases from different vendors. Applications written using the ODBC drivers are guaranteed to work with various databases like PostgreSQL, Oracle, Sybase, Informix etc..

- PostODBC is already included in the distribution. See main web site http://www.postgresql.org. It is included on the PostgreSQL CDROM.
- Open source code ODBC project is at http://www.iodbc.org
- http://www.openlinksw.com Open Link Software Corporation is selling ODBC for PostgreSQL and other databases. Open Link also is giving away free ODBC (limited seats) check them out.
- Insight ODBC for PostgreSQL http://www.insightdist.com/psqlodbc This is the official PostODBC site.
- FreeODBC package http://www.ids.net/~bjepson/freeODBC/ This is a free of cost version of ODBC.

9.2 UDBC Drivers for PostgreSQL

UDBC is a static version of ODBC independent of driver managers and DLL support, used to embed database connectivity support directly into applications.

- http://www.openlinksw.com Open Link Software Corporation is selling UDBC for PostgreSQL and other databases. Open Link also is giving away free UDBC (limited seats) check them out.

9.3 JDBC Drivers for PostgreSQL

JDBC stands for 'Java DataBase Connectivity'. Java is a platform independent programming language developed by Sun Microsystems. Java programmers are encouraged to write database applications using the JDBC to facilitate portability across databases like PostgreSQL, Oracle, informix, etc. If you write Java applications you can get JDBC drivers for PostgreSQL from the following sites:

JDBC driver is already included in the PostgreSQL distribution in postgresql−jdbc*.rpm.

10.Perl Database Interface (DBI) Driver for PostgreSQL

10.1 Perl 5 interface for PostgreSQL

PERL is an acronym for 'Practical Extraction and Report Language'. Perl is available on each and every operating system and hardware platform in the world. You can use Perl on Windows95/NT, Apple Macintosh iMac, all flavors of Unix (Solaris, HPUX, AIX, Linux, Irix, SCO etc..), mainframe MVS, desktop OS/2, OS/400, Amdahl UTS and many others. Perl runs **EVEN** on many unpopular or generally−unknown operating systems and hardware!! So do not be surprised if you see perl running on a very rarely used operating system. You can imagine the vast extent of the user base and developer base of Perl.

Perl interface for PostgreSQL is included in the distribution of PostgreSQL. Check in src/pgsql_perl5 directory.

10.2 Perl Database Interface DBI

WHAT IS DBI ?

The Perl Database Interface (DBI) is a database access Application Programming Interface (API) for the Perl Language. The Perl DBI API specification defines a set of functions, variables and conventions that provide a consistent database interface independent of the actual database being used.

- DBI FAQ author Descartes Hermetica is at descarte@hermetica.com

What is DBI, DBperl, Oraperl and *perl?

To quote Tim Bunce, the architect and author of DBI:

``DBI is a database access Application Programming Interface (API) for the Perl Language. The DBI API Specification defines a set of functions, variables and conventions that provide a consistent database interface independent of the actual database being used."

In simple language, the DBI interface allows users to access multiple database types transparently. So, if you connecting to an Oracle, Informix, mSQL, Sybase or whatever database, you don't need to know the underlying mechanics of the 3GL layer. The API defined by DBI will work on all these database types.

A similar benefit is gained by the ability to connect to two different databases of different vendor within the one perl script, ie, I want to read data from an Oracle database and insert it back into an Informix database all within one program. The DBI layer allows you to do this simply and powerfully.

Here's a list of DBperl modules, their corresponding DBI counterparts and support information. DBI driver queries should be directed to the dbi−users mailing list.

```

            User Agent
```

However, some DBI modules have DBperl emulation layers, so, DBD::Oracle comes with an Oraperl emulation layer, which allows you to run legacy oraperl scripts without modification. The emulation layer translates the oraperl API calls into DBI calls and executes them through the DBI switch.

DBI specifications

There are a few information sources on DBI.

- DBI Specification http://www.hermetica.com/technologia/perl/DBI/doc/dbispec

POD documentation PODs are chunks of documentation usually embedded within perl programs that document the code ``in place'', providing a useful resource for programmers and users of modules. POD for DBI and drivers is beginning to become more commonplace, and documentation for these modules can be read with the following commands.

```
The POD for the DBI Specification can be read with the command
        $ perldoc DBI

Users of the Oraperl emulation layer bundled with DBD::Oracle, may
read up on how to program with the Oraperl interface by typing:
        $ perldoc Oraperl

Users of the DBD::mSQL module may read about some of the private
functions and quirks of that driver by typing:
        $ perldoc DBD::mSQL

The Frequently Asked Questions is also available as
POD documentation. Read this by typing:
        $ perldoc DBI::FAQ

POD in general − Information on writing POD, and on the philosophy of POD in
general, can be read by typing:
        $ perldoc perlpod
```

Users with the Tk module installed may be interested to learn there is a Tk−based POD reader available called tkpod, which formats POD in a convenient and readable way.

Compilation problems or "It fails the test"

If you have a core dump, try the Devel::CoreStack module for generating a stack trace from the core dump. Devel::CoreStack can be found on CPAN at:

- http://www.perl.com/cgi−bin/cpan_mod?module=Devel::CoreStack

Email the dbi−users Mailing List stack trace, module versions, perl version, test cases, operating system versions and any other pertinent information. The more information you send, the quicker developers can track problems down.

Is DBI supported under Windows 95 / NT platforms?

The DBI and DBD::Oracle Win32 ports are now a standard part of DBI, so, downloading DBI of version higher than 0.81 should work fine. You can access Microsoft Access and SQL−Server databases from DBI via ODBC. Supplied with DBI−0.79 (and later) is an experimental DBI 'emulation layer' for the Win32::ODBC module. It's called DBI::W32ODBC. You will need the Win32::ODBC module.

- Win32 DBI http://www.hermetica.com/technologia/perl/DBI/win32
- Win32 ODBC http://www.roth.net

Is DBI any use for CGI programming?

In a word, yes! DBI is hugely useful for CGI programming! In fact, CGI programming is one of two top uses for DBI.

DBI confers the ability to CGI programmers to power WWW−fronted databases to their users, which provides users with vast quantities of ordered data to play with. DBI also provides the possibility that, if a site is receiving far too much traffic than their database server can cope with, they can upgrade the database server behind the scenes with no alterations to the CGI scripts.

How do I get faster connection times with DBD Oracle and CGI?

The Apache httpd maintains a pool of httpd children to service client requests. Using the Apache mod_perl module by Doug MacEachern, the perl interpreter is embedded with the httpd children. The CGI, DBI, and your other favorite modules can be loaded at the startup of each child. These modules will not be reloaded unless changed on disk. For more information on Apache, see the Apache Project's WWW site:

- Apache Project WWW site http://www.apache.org
- Mod_perl module http://www.perl.com/cgi−bin/cpan_mod?module=mod_perl

How do I get persistent connections with DBI and CGI?

Using Edmund Mergl's Apache::DBI module, database logins are stored in a hash with each of these httpd child. If your application is based on a single database user, this connection can be started with each child. Currently, database connections cannot be shared between httpd children. Apache::DBI can be downloaded from CPAN via:

- http://www.perl.com/cgi−bin/cpan_mod?module=Apache::DBI

``When I run a perl script from the command line, it works, but, when I run it under the httpd, it fails!'' Why?

Basically, a good chance this is occurring is due to the fact that the user that you ran it from the command line as has a correctly configured set of environment variables, in the case of DBD::Oracle, variables like $ORACLE_HOME, $ORACLE_SID or TWO_TASK. The httpd process usually runs under the user id of nobody, which implies there is no configured environment. Any scripts attempting to execute in this situation will correctly fail. To solve this problem, set the environment for your database in a BEGIN ( ) block at the top of your script. This will solve the problem. Similarly, you should check your httpd error logfile for any clues, as well as the ``Idiot's Guide To Solving Perl / CGI Problems'' and ``Perl CGI Programming FAQ'' for further information. It is unlikely the problem is DBI−related. Read BOTH these documents carefully!

- Guide to Solving Perl CGI problems http://www.perl.com/perl/faq/index.html

Multi−threading with DBI?

For some OCI example code for Oracle that has multi−threaded SELECT statements, see:

- http://www.hermetica.com/technologia/oracle/oci/orathreads.tar.gz

How can I invoke stored procedures with DBI?

Assuming that you have created a stored procedure within the target database, eg, an Oracle database, you can use $dbh−>do to immediately execute the procedure. For example,

$dbh−>do("BEGIN someProcedure END");

How can I get return values from stored procedures with DBI?

Remember to perform error checking, though!

```
$sth = $dbh->prepare( "BEGIN foo(:1, :2, :3); END;" );
$sth->bind_param(1, $a);
$sth->bind_param_inout(2, \$path, 2000);
$sth->bind_param_inout(3, \$success, 2000);
$sth->execute;
```

How can I create or drop a database with DBI?

Database creation and deletion are concepts that are entirely too abstract to be adequately supported by DBI. For example, Oracle does not support the concept of dropping a database at all! Also, in Oracle, the database server essentially is the database, whereas in mSQL, the server process runs happily without any databases created in it. The problem is too disparate to attack. Some drivers, therefore, support database creation and deletion through the private func methods. You should check the documentation for the drivers you are using to see if they support this mechanism.

How are NULL values handled by DBI?

NULL values in DBI are specified to be treated as the value undef. NULLs can be inserted into databases as NULL, for example:

```
$rv = $dbh->do( "INSERT INTO table VALUES( NULL )" );
```

but when queried back, the NULLs should be tested against undef. This is standard across all drivers.

What are these func methods all about?

The func method is defined within DBI as being an entry point for database−specific functionality, eg, the ability to create or drop databases. Invoking these driver−specific methods is simple, for example, to invoke a createDatabase method that has one argument, we would write:

```
$rv = $dbh->func( 'argument', 'createDatabase' );
```

Software developers should note that the func methods are non−portable between databases.

Commercial Support and Training

PERL CLINIC : The Perl Clinic can arrange commercial support contracts for Perl, DBI, DBD::Oracle and Oraperl. Support is provided by the company with whom Tim Bunce, author of DBI, works. For more information on their services, please see :

10.3 Testing Perl interface

See the section −

11.PostgreSQL Management Tools

11.1 PGACCESS − A GUI Tool for PostgreSQL Management

PgAccess is a Tcl/Tk interface to PostgreSQL. It is already included in the distribution of PostgreSQL. You may want to check out this web site for a newer copy

- http://www.flex.ro/pgaccess
- If you have any comment, suggestion for improvements, e−mail to : teo@flex.ro

Usage of pgaccess −

```
# man xhost
# xhost +
# su − postgres
bash$ man pgaccess
bash$ export DISPLAY=<hostname>:0.0
bash$ pgaccess mydatabase
```

Features of PgAccess

PgAccess windows − Main window, Table builder, Table(query) view, Visual query builder.

Tables

- opening tables for viewing, max 200 records (changed by preferences menu)
- column resizing, dragging the vertical grid line (better in table space rather than in the table header)
- text wrap in cells − layout saved for every table
- import/export to external files (SDF,CSV)
- filter capabilities (enter filter like (price>3.14)
- sort order capabilities (enter manually the sort field(s))
- editing in place
- improved table generator assistant
- improved field editing

Queries

- define , edit and stores "user defined queries"
- store queries as views
- execution of queries
- viewing of select type queries result
- query deleting and renaming

- Visual query builder with drag & drop capabilities. For any of you who had installed the Tcl/Tk plugin for Netscape Navigator, you can see it at work clicking here

Sequences

- defines sequences, delete them and inspect them Functions
- define, inspect and delete functions in SQL language

Future implementation will have

- table design (add new fields, renaming, etc.)
- function definition
- report generator
- basic scripting

INFORMATION ABOUT LIBGTCL

You will need the PostgreSQL to Tcl interface library libgtcl, lined as a Tcl/Tk 'load'−able module. The libpgtcl and the source is located in the PostgreSQL directory /src/interfaces/libpgtcl. Specifically, you will need a libpgtcl library that is 'load'−able from Tcl/Tk. This is technically different from an ordinary PostgreSQL loadable object file, because libpgtcl is a collection of object files. Under Linux, this is called libpgtcl.so. You can download from the above site a version already compiled for Linux i386 systems. Just copy libpgtcl.so into your system library director (/usr/lib). One of the solutions is to remove from the source the line containing load libpgtcl.so and to load pgaccess.tcl not with wish, but with pgwish (or wishpg) that wish that was linked with libpgtcl library.

If you get crypt not found during compilation pgaccess source tree then use −lcrypt.

11.2 Windows Interactive Query Tool for PostgreSQL (WISQL or MPSQL)

MPSQL provides users with a graphical SQL interface to PostgresSQL. MPSQL is similar to Oracle's SQL Worksheet and Microsoft SQL Server's query tool WISQL. It has nice GUI and has history of commands. Also you can cut and paste and it has other nice features to improve your productivity.

- http://www.ucolick.org/~de/ in file tcl_syb/wisql.html
- http://www.troubador.com/~keidav/index.html
- Email: de@ucolick.org

11.3 Interactive Query Tool (ISQL) for PostgreSQL called PSQL

ISQL is for character command line terminals. This is included in the distribution, and is called "psql". Very similar to Sybase ISQL, Oracle SQLplus. At unix prompt give command 'psql' which will put you in psql>

prompt.

```
bash# su − postgres
bash$ man psql
bash$ psql mydatabase
Type \h to see help of commands.
```

Very user friendly and easy to use. Can also be accessed from shell scripts.

11.4 MPMGR − A Database Management Tool for PostgresSQL

MPMGR will provide a graphical management interface for PostgresSQL. You can find it at

12.Setting up multi−boxes PostgreSQL with just one monitor

If you do want to spend money on hardware switches than you can **use VNC (Virtual Network Computing) Technology** from the telecom giant AT & T. VNC is GPLed and is a free software. Using VNC you can run PostgreSQL programs on computers without monitors and display on remote boxes with monitors!! But the boxes must be connected via ethernet Network Interface Cards. VNC is at http://www.uk.research.att.com/vnc

You can stack up multiple CPU−boxes and connect to just one monitor and use the KVM (Keyboard, Video, Monitor) switch box to select the host. This saves space and avoids a lot of clutter and also eliminates monitor, keyboard and the mouse (saving anywhere from 100 to 500 US dollars per set).

Using this switch box, you can stack up many PostgreSQL servers (development, test, production), Web servers, ftp servers, Intranet servers, Mail servers, News servers in a tower shelf. The switch box can be used for controlling Windows 95/NT or OS/2 boxes as well.

Please check out these sites:

- DataComm Warehouse Inc at 1−800−328−2261. They supply all varieties of computer hardware http://www.warehouse.com 4−port Manual KVM switch (PS/2) is about $89.99 Part No. DDS1354
- Network Technologies Inc http://www.networktechinc.com/servswt.html (120 dollars/PC 8 ports) which lists 'Server Switches' and 'Video only switches'

- RealStar Solutions Inc http://www.real−star.com/kvm.htm
- Belkin Inc http://www.belkin.com
- Better Box Communications Ltd. http://www.betterbox.com/info.html
- Go to nearest hardware store and ask for "Server Switch" also known as "KVM Auto Switches".

Search engine yahoo to find more companies with "Server Switches" or "KVM Switches".

It is strongly recommended to have a dedicated unix box for each PostgreSQL data−server for better performance. No other application program/processes should run on this box. See the Business section of your local newspapers for local vendors selling only intel box, 13" monochrome monitor (very low cost monitor). Local vendors sell just the hardware **without** any Microsoft Windows/DOS. You do not need a color monitor for the database server, as you can do remote administration from color PC workstation. Get RedHat (or some other distribution of) Linux cdrom from below −

- Linux System Labs Web site: http://www.lsl.com/ 7 (U.S. dollars)
- Cheap Bytes Inc Web site: http://www.cheapbytes.com/ 7 (U.S. dollars)

Make sure that the hardware you purchase is supported by Redhat Linux. Check the ftp site of Redhat for recommended hardware like SCSI adapters, video cards before buying. For just $ 600 you will get a powerful intel box with Redhat Linux running PostgreSQL. Use odbc/jdbc/perl/tcl to connect to PostgreSQL from Windows95, OS/2, Unix Motif or web browser (e.g. Redbaron, Opera, Netscape, 20 others). (Web browsers are very fast becoming the standard GUI client).

Using KVM switch you can control many cpu boxes by just one monitor and one keyboard!

14.Applications and Tools for PostgreSQL

14.1 PostgreSQL 4GL for web database applications − AppGEN Development System

AppGEN can be downloaded from

- http://www.man.ac.uk/~whaley/ag/appgen.html
- ftp://ftp.mcc.ac.uk/pub/linux/ALPHA/AppGEN.

AppGEN is a high level fourth generation language and application generator for producing World Wide Web (WWW) based applications. These applications are typically used over the internet or within a corporate

intranet. AppGEN applications are implemented as C scripts conforming to the Common Gateway Interface (CGI) standard supported by most Web Servers.

To use AppGEN you will need the following :−

PostgresSQL, relational database management system

A CGI compatible web server such as NCSA's HTTPD

An ansi C compiler such as GCC

AppGEN consists of the following Unix (Linux) executables :−

- defgen, which produces a basic template application from a logical data structure. The applications are capable of adding, updating, deleting and searching for records within the database whilst automatically maintaining referential integrity.
- appgen, the AppGEN compiler which compiles the appgen source code into CGI executable C source and HTML formatted documents ready for deployment on a web server.
- dbf2sql, a utility fo converting dBase III compatible .dbf files into executable SQL scripts. This enables data stored in most DOS/Windows based database packages to be migrated to a SQL server such as PostgresSQL.
- In addition, AppGEN comprises of a collection of HTML documents, GIF files and Java applets which are used at runtime by the system. And of course, like all good software, the full source code is included.

The author, Andrew Whaley, can be contacted on

14.2 WWW Web interface for PostgresSQL − DBENGINE

dbengine a plug 'n play Web interface for PostgreSQL created by Ingo Ciechowski. It is at

- http://www.cis−computer.com/software/dbengine

About DBENGINE : dbengine is an interface between the WWW and Postgres95 which provides simple access to any existing database within just a few minutes.

PHP gives you a Perl like language in your documents, but no real Perl while AppGen and wdb−p95 require that you create some configuration file for each of your databases −− sound's like you'll first of all have to learn some sort of new meta language before you can get started.

Unlike other tools you don't have to learn any special programming or scripting language to get started with dbengine. Also there's no configuration file for each database, so you don't have to get familiar with such a new structure. However − in case you want to gain access to the full features of dbengine it'd be a good idea to know the Perl language.

The whole system can be configured by simple manipulations of an additional database that contains closer information about how to visualize your database access. You can even specify virtual Fields which are

calculated on the fly right before they're displayed on the screen.

14.3 Apache Webserver Module for PostgreSQL − NeoSoft NeoWebScript

Apache is a well−known Web Server. And a module to interface PostgreSQL to Apache Webserver is at −

- http://www.neosoft.com/neowebscript/

NeoWebScript is a programming language that allows both simple and complex programs to be embedded into HTML files.

When an HTML page containing embedded NeoWebScript is requested, the NeoWebScript−enabled webserver executes the embedded script(s), producing a webpage containing customized content created by the program.

NeoWebScript is a fast, secure, easy to learn way to do powerful, server−based interactive programming directly in the HTML code in web pages. With NeoWebScript, counters, email forms, graffiti walls, guest books and visitor tracking are all easy, even for a beginning programmer. See how well NeoWebScript holds its' own vs. PERL and JavaScript.

If you'd like to install NeoWebScript on your webserver, your Webmaster needs to read our Sysop FAQ to get started. Theory of Operations will explain how NeoWebScript works, while installation will take them through the steps. Management deals with configuration issues and running the server, tests let you verify correct NeoWebScript operation, and troubleshooting deals with server problems.

There is no cost to you to use NeoWebScript−2.2 for your ISP, your intranet, or your extranet. You'll see a full license when you register to download, but it costs $ 99 if you want to embed it in your own product or use it in a commerce (eg. SSL) server.

NeoWebScript is a module for the Apache webserver that allows you to embed the Tcl/Tk programming language in your webpages as a scripting tool. It was invented by Karl Lehenbauer, NeoSoft's Chief Technical Officer, and documented, enhanced and extended by NeoSoft's programmers and technical writers.

The Apache webserver is the world's most popular webserver, accounting for 68 % of the sites polled.

Tcl/Tk is the powerful, free, cross−platform scripting language developed by Dr. John Ousterhout. In his own words

"Tcl/Tk lets software developers get the job done ten times faster than with toolkits based on C or C++. It's also a great glue language for making existing applications work together and making them more graphical and Internet−aware."

Karl Lehenbauer, Founder and Chief Technical Officer of NeoSoft, has been part of Tcl/Tk development from the very beginning. Together with Mark Diehkans, they authored Extended Tcl, also known as TclX or NeoSoft Tcl, a powerful set of extensions to the language. Many of the current core Tcl commands originated in Extended Tcl, and were then imported into the core language by Dr. Ousterhout.

14.4 HEITML server side extension of HTML and a 4GL language for PostgreSQL

Tool heitml is another way to interface postgres with the world wide web. For more details contact

```
Helmut Emmelmann H.E.I. Informationssyteme GmbH
Wimpfenerstrasse 23 Tel. 49−621−795141

```

- E−mail Mr.Helmut Emmelmann at emmel@h−e−i.de
- Heitml main web site http://www.heitml.com
- Heitml secondary web site http://www.h−e−i.deom

heitml is a server side extension of HTML and a 4GL language at the same time. People can write web applications in the HTML style by using new HTML−like tags.

heitml (pronounced "Hi"−TML) is an extension of HTML and a full−featured 4th generation language that enables Web−based Applications to interact with data stored in SQL databases, without resorting to complex CGI scripts.

heitml extends HTML on the sever side, dynamically converting ".hei" files to HTML format and so is compatible with any web browser.It embraces the familiar, easy−to−use HTML syntax and provides a large assortment of pre−developed Tags and Libraries to take care of tasks that formerly required CGI. As XML, heitml provides user defined tags. With heitml the user defined markup can be translated to HTML and send to a browser.

heitml targets both HTML designers and professional programmers alike. HTML designers can use heitml Tags to build dynamic web pages, access SQL databases, or create complete web applications. Counters, registration databases, search forms, email forms, or hierarchical menues can all be created simply by using the pre−developed HTML−like Tags found in the many Component Libraries.

For programmers heitml embeds a complete forth generation language in HTML

```
(e.g. <if>, <while>, and <let> Tags),
```

plus powerful expression evaluation with integer, real, boolean, string, and tuple data types. Tuples have reference semantics as in modern object oriented languages and are stored on a heap. heitml variables including all complex data structures stored on the heap maintain their values between pages using the Session Mode. It is possible to define your own tags or environment tags and even re−define HTML−tags.

heitml makes it possible to

− − − develop Web Sites in a structured and modular way, drastically reducing maintenance overhead.

− − − develop intelligent and interactive Web Sites, with content that dynamically adapts itself to user needs.

− − − show the content of SQL databases with no programming other than to use our library of prefined "dba" Tags.

− − − develop complex database and Catalog Shopping applications using Session Variables

heitml runs on Linux with any Web Server using the CGI interface, and is especially fast (avoiding the CGI overhead) within the APACHE Web Server using the apache API. Currently MSQL (Version 1 and 2), PostgreSQL (Version 6), mysql, and the yard databases are supported). heitml also works on Linux, BSDi, Solaris and SunOS, as well as Windows NT with CGI and ISAPI and ODBC and Windows 95.

heitml (on linux) is free for research, non−commercial and private usage. Commercial Web Sites must pay a licensing fee. The fully operational version of heitml is available for a trial period downloaded freely. (Note, however, that each ".hei" Web Page you develop will display a message identifying it as the version for non−commercial use. After registration, you will receive a key to switch off the message without having to re−install the program.)

heitml (pronounced "Hi"−TML) significantly extends and enhances the functionality of HTML by definable tags and full programming features. This makes dynamic content and database applications possible simply within the HTML world, without CGI and without external scripting or programming languages. This means you, as an HTML author, can embed applications in your web pages, simply by using some new tags without CGI and without programming. As an advanced user or programmer on the other hand you can create and program powerful tag libraries. This approach makes heitml suitable for HTML newcomers and professional programmers alike. heitml runs on the web server and dynamically generates HTML, so heitml is compatible with the internet standards and with any web browser. It allows full access to databases while shielding the user from any unneccessary CGI complexity. heitml has been developed according to the newst research and in compiler construction and transaction systems.

heitml pages are developed just the same way as HTML pages, with a text editor or HTML editor, and placed on the web server as usual. However now pages can contain dynamic heitml tags and access tag libraries. You can use these tags to access the database, to create dynamic content, to send emails, and even to create powerful applications like registration databases and shopping systems.

HTML newcomers and professional programmers alike will be amazed at how quickly and easily they can design exciting applications like our Interactive Guestbook without resorting to complex and difficult to learn CGI scripts, simply by using the tools provided in our dba Library.

heitml is accompanied by a wide range of tag libraries, to create guestbooks, database maintenance applications, extensible query forms, powerful email forms or structure your web site using a hierarchic menu. These tools are ready to go, just add the corresponding tags to your web site.

As an experienced programmer you can make fully use of the heitml persistent dynamic tuple architecture : heitml is not just a scripting language with dynamic typing, full power expression evaluation, recursive procedures and extensive parameter passing features, but it also features persistent dynamic tuples to automatically keep session data of any size.

14.5 America On−line AOL Web server for PostgreSQL

The no−cost commercial webserver, AOLserver supports database connections to PostgreSQL for more information see

- AOL Web Server home http://www.aolserver.com
- Introduction to AOLserver by Philip Greenspun http://photo.net/wtr/aolserver/introduction−1.html

AOLserver is a fast, fully multithreaded, Tcl enabled webserver. But not only that, it is a complete database−backed web development platform. With AOLserver you can have multiple pooled connections to PostgreSQL (and other RBDMSs) that can be shared among different threads. AOLserver has a Tcl and C APIs that allow you to develop powerful dynamic websites. All this since 1995. It is licensed under the APL (AOLserver Public License) or the GPL, thus being totally free software. The Tcl API is the most useful for web sites. AOLserver has a set of powerful Tcl calls, such as ns_sendmail (to send e−mail), ns_httpget (to fetch a URL), ns_schedule (a cron−like feature to schedule procedures to run at specific times), etc. You can also extend AOLserver's capabilities very easily with the Tcl API. Each AOLserver virtual server can have its own "library" of private Tcl scripts that are parsed by AOLserver and become accessible to any page within that virtual server. You can develop pages for AOLserver in three ways: − Plain HTML − .tcl pages −− these are tcl programs that can return HTML via the ns_write call. − .adp pages −− AOL Dynamic Pages. You develop your pages in plain HTML but you can scape to Tcl code by using <% %> or <%= %> much alike PHP or ASP. While AOLserver is a great webserver with a superb architecture, where it really shines is in database connectivity. AOLserver has its own database abstraction layer that enables you to have it connected to different RDBMSs without changing your code at all. The connections do the RDBMS are pooled, persistent and are shared among different threads. This allows for very fast connections and efficient use of resources. AOLserver has drivers for all major RDBMSs: PostgreSQL, Oracle, Sybase, Informix, Illustra, Solid, Interbase, MySQL.

15.Web Database Design/Implementation tool for PostgreSQL − EARP

- http://www.oswego.edu/Earp
- ftp://ftp.oswego.edu in the directory 'pub/unix/earp'.

15.1 What is EARP ?

The "Easily Adjustable Response Program" (EARP) created by David Dougherty. EARP is a Web Database Design/Implementation tool, built on top of the PostgreSQL database system. Its functionality includes:

- A Visual Design System.
- A sendmail interface. (can handle incoming and outgoing mail)
- An Enhanced Security Mechanism.
- A cgi driver.

15.2 Implementation

The main implementation of EARP is a CGI binary which runs under the http daemon to provide access to the database server. All of the design tools are built into the driver, no design takes place over anything but the web. The tools themselves require a graphical browser, the compatibility of objects designed with the tools is implementation independent, based on designing individuals preferences.

15.3 How does it work ?

One of the main features of EARP is that it uses an Object Oriented approach to producing html pages which interface to the database. Most pages will consist of several objects. Each object is produced by some sort of tool and given a name, objects are then linked together in a callable sequence by the page tool. Objects are also reusable across multiple pages. Basic tools exist for HTML, Querys, Grabbing input from forms, Extendable Formatting of Query and Input objects, and Linking together of objects into other objects. More advanced tools include the mail tool and the multithreaded query tool.

Another feature of EARP is advanced security. Access to various areas of the EARP system can be limited in

a variety of ways. To facilitate its advanced security, EARP performs checks for each connection to the system, determining what ids and groups the connecting agent belongs to. Access to areas is defined seperately, and the combination decides if access to a specific area of Earp is allowed. Moreover, all that is required to implement the security features is an http server that supports basic (or better) user authentication.

15.4 Where to get EARP ?

EARP is available via anonymous ftp from

- ftp://ftp.oswego.edu in the directory 'pub/unix/earp'.

16.PHP Hypertext Preprocessor − Server−side html−embedded scripting language for PostgreSQL

WWW Interface Tool is at −

- http://www.php.net
- http://www.vex.net/php

PHP also has a compiler called Zend which will vastly improve the performance. First you will write your application in PHP scripting language during development, testing and debugging. Once the project is ready for deployment you will use the Zend compiler to compile the PHP to create executable which will run very fast.

Old name is Professional Home Pages (PHP) and new name is PHP Hypertext Pre−Processor

- Mirror sites are in many countries like www.COUNTRYCODE.php.net
- http://www.fe.de.php.net
- http://www.sk.php.net
- http://php.iquest.net/
- Questions e−mail to : rasmus@lerdorf.on.ca

PHP is a server−side html−embedded scripting language. It lets you write simple scripts right in your .HTML files much like JavaScript does, except, unlike JavaScript PHP is not browser−dependant. JavaScript is a client−side html−embedded language while PHP is a server−side language. PHP is similar in concept to Netscape's LiveWire Pro product. If you like free fast−moving software that comes with full source code you will probably like PHP.

- The PostgreSQL support code was written by Adam Sussman asussman@vidya.com

16.1 Major Features

- Standard CGI, FastCGI and Apache module support − As a standard CGI program, PHP can be installed on any Unix machine running any Unix web server. With support for the new FastCGI standard, PHP can take advantage of the speed improvements gained through this mechanism. As an Apache module, PHP becomes an extremely powerful and **lightning fast** alternative to CGI programmimg.
- Access Logging − With the access logging capabilities of PHP, users can maintain their own hit counting and logging. It does not use the system's central access log files in any way, and it provides real−time access monitoring. The Log Viewer Script provides a quick summary of the accesses to a set of pages owned by an individual user. In addition to that, the package can be configured to generate a footer on every page which shows access information. See the bottom of this page for an example of this.
- Access Control − A built−in web−based configuration screen handles access control configuration. It is possible to create rules for all or some web pages owned by a certain person which place various restrictions on who can view these pages and how they will be viewed. Pages can be password protected, completely restricted, logging disabled and more based on the client's domain, browser, e−mail address or even the referring document.
- PostgresSQL Support − Postgres is an advanced free RDBMS. PHP supports embedding PostgreSQL "SQL queries" directly in .html files.
- RFC−1867 File Upload Support − File Upload is a new feature in Netscape 2.0. It lets users upload files to a web server. PHP provides the actual Mime decoding to make this work and also provides the additional framework to do something useful with the uploaded file once it has been received.
- HTTP−based authentication control − PHP can be used to create customized HTTP−based authentication mechanisms for the Apache web server.
- Variables, Arrays, Associative Arrays − PHP supports typed variables, arrays and even Perl−like associative arrays. These can all be passed from one web page to another using either GET or POST method forms.
- Conditionals, While Loops − PHP supports a full−featured C−like scripting language. You can have if/then/elseif/else/endif conditions as well as while loops and switch/case statements to guide the logical flow of how the html page should be displayed.
- Extended Regular Expressions − Regular expressions are heavily used for pattern matching, pattern substitutions and general string manipulation. PHP supports all common regular expression operations.
- Raw HTTP Header Control − The ability to have web pages send customized raw HTTP headers based on some condition is essential for high−level web site design. A frequent use is to send a Location: URL header to redirect the calling client to some other URL. It can also be used to turn off cacheing or manipulate the last update header of pages.
- On−the−fly GIF image creation − PHP has support for Thomas Boutell's GD image library which makes it possible to generate GIF images on the fly.
- ISP "Safe Mode" support − PHP supports a unique "Safe Mode" which makes it safe to have multiple users run PHP scripts on the same server.
- Many more new features are being added in newer releases of PHP. Visit the main web site at http://www.php.net
- It's Free! − One final essential feature. The package is completely free. It is licensed under the GNU/GPL which allows you to use the software for any purpose, commercial or otherwise.

16.2 PHP − Brief History

PHP began life as a simple little cgi wrapper written in Perl. The name of this first package was Personal Home Page Tools, which later became Personal Home Page Construction Kit.

A tool was written to easily embed SQL queries into web pages. It was basically another CGI wrapper that parsed SQL queries and made it easy to create forms and tables based on these queries. This tool was named FI (Form Interpreter).

PHP/FI version 2.0 is a complete rewrite of these two packages combined into a single program. It evolved to a simple programming language embedded inside HTML files. PHP eliminates the need for numerous small Perl cgi programs by allowing you to place simple scripts directly in your HTML files. This speeds up the overall performance of your web pages since the overhead of forking Perl several times has been eliminated. It also makes it easier to manage large web sites by placing all components of a web page in a single html file. By including support for various databases, it also makes it trivial to develop database enabled web pages. Many people find the embedded nature much easier to deal with than trying to create separate HTML and CGI files.

Now PHP/FI is renamed as PHP.

16.3 So, what can I do with PHP ?

The first thing you will notice if you run a page through PHP is that it adds a footer with information about the number of times your page has been accessed (if you have compiled access logging into the binary). This is just a very small part of what PHP can do for you. It serves another very important role as a form interpreter cgi, hence the FI part of the old name. For example, if you create a form on one of your web pages, you need something to process the information on that form. Even if you just want to pass the information to another web page, you will have to have a cgi program do this for you. PHP makes it extremely easy to take form data and do things with it.

16.4 A simple example

Suppose you have a form:

```
<FORM ACTION="/cgi−bin/php.cgi/~userid/display.html" METHOD=POST>
<INPUT TYPE="text" name="name">
<INPUT TYPE="text" name="age">
<INPUT TYPE="submit">
<FORM>
```

Your display.html file could then contain something like:

```
< ?echo "Hi $ name, you are $ age years old!<p>" >
```

It's that simple! PHP automatically creates a variable for each form input field in your form. You can then use these variables in the ACTION URL file.

The next step once you have figured out how to use variables is to start playing with some logical flow tags in your pages. For example, if you wanted to display different messages based on something the user inputs, you would use if/else logic. In our above example, we can display different things based on the age the user entered by changing our display.html to:

```
<?
    if($age>50);
        echo "Hi $name, you are ancient!<p>";
    elseif($age>30);
        echo "Hi $name, you are very old!<p>";
    else;
        echo "Hi $name.";
    endif;
>
```

PHP provides a very powerful scripting language which will do much more than what the above simple example demonstrates. See the section on the PHP Script Language for more information.

You can also use PHP to configure who is allowed to access your pages. This is done using a built−in configuration screen. With this you could for example specify that only people from certain domains would be allowed to see your pages, or you could create a rule which would password protect certain pages. See the Access Control section for more details.

PHP is also capable of receiving file uploads from any RFC−1867 compliant web browser. This feature lets people upload both text and binary files. With PHP's access control and logical functions, you have full control over who is allowed to upload and what is to be done with the file once it has been uploaded. See the File Upload section for more details.

PHP has support for the PostgreSQL database package. It supports embedded SQL queries in your .HTML files.

PHP also has support for the mysql database package. It supports embedded SQL queries in your .HTML files.

16.5 CGI Redirection

Apache 1.0.x Notes

A good way to run PHP is by using a cgi redirection module with the Apache server. Please note that you do not need to worry about redirection modules if you are using the Apache module version of PHP. There are two of these redirection modules available. One is developed by Dave Andersen

- angio@aros.net

and it is available at

- ftp://ftp.aros.net/pub/util/apache/mod_cgi_redirect.c

and the other comes bundled with Apache and is called mod_actions.c. The modules are extremely similar.

They differ slightly in their usage. Both have been tested and both work with PHP.

Check the Apache documentation on how to add a module. Generally you add the module name to a file called Configuration. The line to be added if you want to use the mod_actions module is:

Module action_module mod_actions.o

If you are using the mod_cgi_redirect.c module add this line:

Module cgi_redirect_module mod_cgi_redirect.o

Then compile your httpd and install it. To configure the cgi redirection you need to either create a new mime type in your mime.types file or you can use the AddType command in your srm.conf file to add the mime type. The mime type to be added should be something like this:

```
application/x−httpd−php phtml
```

If you are using the mod_actions.c module you need to add the following line to your srm.conf file:

```
Action application/x−httpd−php /cgi−bin/php.cgi
```

If you are using mod_cgi_redirect.c you should add this line to srm.conf:

```
CgiRedirect application/x−httpd−php /cgi−bin/php.cgi
```

Don't try to use both mod_actions.c and mod_cgi_redirect.c at the same time.

Once you have one of these cgi redirection modules installed and configured correctly, you will be able to specify that you want a file parsed by PHP simply by making the file's extension .phtml. Furthermore, if you add index.phtml to your DirectoryIndex configuration line in your srm.conf file then the top−level page in a directory will be automatically parsed by php if your index file is called index.phtml.

Netscape HTTPD

You can automatically redirect requests for files with a given extension to be handled by PHP by using the Netscape Server CGI Redirection module. This module is available in the File Archives on the PHP Home Page. The README in the package explicitly explains how to configure it for use with PHP.

NCSA HTTPD

NCSA does not currently support modules, so in order to do cgi redirection with this server you need to modify your server source code. A patch to do this with NCSA 1.5 is available in the PHP file archives.

16.6 Running PHP from the command line

If you build the CGI version of PHP, you can use it from the command line simply typing: php.cgi filename where filename is the file you want to parse. You can also create standalone PHP scripts by making the first line of your script look something like:

```
#!/usr/local/bin/php.cgi −q
```

The "−q" suppresses the printing of the HTTP headers. You can leave off this option if you like.

17.Python Interface for PostgreSQL

Python in an interpreted, object orientated scripting language. It is simple to use (light syntax, simple and straighforward statements), and has many extensions for building GUIs, interfacing with WWW, etc. An intelligent web browser (HotJava like) is currently under development (november 1995), and this should open programmers many doors. Python is copyrighted by Stichting S Mathematisch Centrum, Amsterdam, The Netherlands, and is freely distributable. It contains support for dynamic loading of objects, classes, modules, and exceptions. Adding interfaces to new system libraries through C code is straightforward, making Python easy to use in custom settings. Python is a very high level scripting language with X interface. Python package is distributed on Linux cdroms includes most of the standard Python modules, along with modules for interfacing to the Tix widget set for Tk.

PyGreSQL is a python module that interfaces to a PostgreSQL database. It embeds the PostgreSQL query library to allow easy use of the powerful PostgreSQL features from a Python script. PyGreSQL is written by D'Arcy J.M. Cain and Pascal Andre.

17.1 Where to get PyGres ?

The home sites of the differents packages are:

- Python ftp://ftp.python.org:/pub/www.python.org/1.5/python1.5b2.tar.gz
- PyGreSQL ftp://ftp.druid.net/pub/distrib/PyGreSQL−2.1.tgz
- Old site ftp://ftp.via.ecp.fr/pub/python/contrib/Database/PyGres95−1.0b.tar.gz

You should anyway try to find some mirror site closer of your site. Refer to the information sources to find these sites. PyGreSQL should reside in the contrib directories of Python and PostgreSQL sites.

17.2 Information and support

If you need information about these packages please check their web sites:

- Python : http://www.python.org/
- PostgreSQL : http://epoch.cs.berkeley.edu:8000/postgres95/index.html
- PyGreSQL ftp://ftp.druid.net/pub/distrib/PyGreSQL−2.1.tgz
- Old site PyGreSQL : http://www.via.ecp.fr/via/products/pygres.html

For support :

- Mailing list for PyGreSQL. You can join by sending email to majordomo@vex.net with the line "subscribe pygresql name@domain" in the body replacing "name@domain" with your own email address.
- Newsgroup for Python : newsgroup comp.lang.python
- PyGreSQL : contact Andre at andre@via.ecp.fr for bug reports, ideas, remarks

17.3 Testing Python interface

See the section −

18.Gateway between PostgreSQL and the WWW − WDB−P95

18.1 About wdb−p95

WDB−P95 − A Web interface to PostgreSQL Databases was created by J. Douglas Dunlop It is at

- New WDB from J Rowe is at http://www.lava.net/beowulf/programming/wdb
- New versions of WWW−WDB is at http://www.eol.ists.ca/~dunlop/wdb−p95/
- For questions or to join Mailing lists contact dunlop@eol.ists.ca

This is a modified version of wdb−1.3a2 which provides a gateway to a the WWW for PostgreSQL. This version also requires a Browser that is capable of handling HTML Tables for the tabular output. This is not required by the original wdb and can be fairly easily reverted.

You can try out CASI Tape and Image Query. You can have a peek at the Form Definition File (FDF) which is used to create the CASI Tape and Image Query too, which includes a JOIN of 2 tables.

This release contains all files necessary to install and run WDB−P95 as an interface to your PostgreSQL databases. To port this system to other database should be relatively easy − provided that it supports standard SQL and has a Perl interface.

18.2 Does the PostgreSQL server, pgperl, and httpd have to be on the same host?

No − the PostgreSQL server does not have to be on the same host. As WDB−P95 is called by the http daemon, they have to be on the same host. − And as WDB−P95 was written to use Pg.pm − pgperl has to be on the same host too. Pgperl was written using the libpq library, so it will be able to access any PostgreSQL server anywhere in the net, just like any other PostgreSQL client. As illustrated below

(WWW Client (Netscape)) => (HTTP Server (NCSA's http) + WDB−P95 + pgperl + libpq)=> (PostgreSQL server)

Curly brackets () represent machines.

Each machine can be of a different type : NT, SUN, HP, ... but you need the libpq interface library for the machine type where you plan to use WDB−P95, as you need it to compile pgperl. (The system was designed to use HTML tables so a recent WWW client is best)

19."C", "C++", ESQL/C language Interfaces and Bitwise Operators for PostgreSQL

19.1 "C" interface

It is included in distribution and is called 'libpq'. Similar to Oracle OCI, Sybase DB−lib, Informix CLI libraries.

19.2 "C++" interface

It is included in distribution and is called 'libpq++'. See the section − Testing C and C++ PostgreSQL interface

19.3 ESQL/C

ESQL/C 'Embedded C Pre−compiler' for PostgreSQL ESQL/C is like Oracle Pro*C, Informix ESQL/C. The PostgreSQL ESQL/C is an SQL application−programming interface (API) enables the C programmer to create custom applications with database−management capabilities. The PostgreSQL ESQL/C allows you to use a third−generation language with which you are familiar and still take advantage of the Structured Query Language (SQL).

ESQL/C consists of the following pieces of software:

- The ESQL/C libraries of C functions provide access to the database server.
- The ESQL/C header files provide definitions for the data structures, constants, and macros useful to the ESQL/C program.

- The ESQL/C preprocessor, is a source−code preprocessor that converts a C file containing SQL statements into an executable file.

It is at

- ESQL/C for PostgreSQL is already included in the distribution.
- Main site ftp://ftp.lysator.liu.se/pub/linus
- Email : linus@epact.se

See the section − Testing Embedded SQL/C interface to PostgreSQL

19.4 BitWise Operators for PostgreSQL

Bitwise operators was written by Nicolas Moldavsky

- nico@overnet.com.ar

"C" functions that implement bitwise operators (AND, OR, XOR, bit complement) on pgsql. Get them by anonymous FTP from

- ftp://ftp.overnet.com.ar/pub/utils/linux/bitpgsql.tgz

Makefile for Linux is included.

20.Japanese Kanji Code for PostgreSQL

It is at the following site

- ftp://ftp.sra.co.jp/pub/cmd/postgres/

21.PostgreSQL Port to Windows 95/Windows NT

Port to Windows NT is done and is available from http://www.postgresql.org. You can download the PostgreSQL binaries for Windows NT from download page and will save you time. If you want to re−compile the source tree then follow the instructions given below. Porting to NT is done using Cygnus cygwin32 package which has gcc, gmake for Win NT/95.

- Cygwin 32 package is at http://www.cygnus.com/misc/gnu−win32

At this site and get the file cdk.exe (self−extractor file for gnu−win32)

21.1 Authors of NT port

The authors of Windows NT port of PostgreSQL are −

- Daniel Horak horak@mmp.plzen−city.cz
- Joost Kraaijeveld JKraaijeveld@askesis.nl
- Kevin Lo kevlo@FreeBSD.org
- Home page of NT port is at http://www.freebsd.org/~kevlo/postgres/portNT.html

21.2 Install the Cygwin package

1. Download ftp://go.cygnus.com/pub/sourceware.cygnus.com/cygwin/latest/full.exe
2. Run full.exe and install in c:\Unix\Root directory.
3. Run Cygwin, Type 'mount −−help' for docs. You can use −f switch to force mount. And then run "umount / " and "mount c:\Unix\Root /"

21.3 Install the Andy Piper tools

1. Go to ftp://ftp.xemacs.org/pub/xemacs/aux/ and download cygwin−b20−local.tar.bz2 in the c:/Unix/Root directory.
2. cd c:/Unix/Root; bunzip2 cygwin−b20−local.tar.bz2
3. tar −xvf cygwin−b20−local.tar
4. cd /local/bin; sh check_cygwin_setup.sh
5. After doing step 4, you see the following message:

```
You don't have /bin would you like to mount cygwin as /bin?"
[ y/n ]
Select 'n',  and the other options are selected 'y'
```

6. mount c:/Unix/Root/cygwin−b20/H−i586−cygwin32/i586−cygwin32/bin /bin
7. cd c:/Unix/Root/cygwin−b20/H−i586−cygwin32/i586−cygwin32; mkdir libexec share man etc sbin info
8. cp −R /local/{ bin,libexec,share,man,etc,sbin,info,include }

21.4 Install Ludovic Lange's Cygwin32 IPC package

1. Go to http://www.multione.capgemini.fr/tools/pack_ipc and download cygwin32_ipc−1.03.tgz in c:/Unix/Root directory.
2. tar −zxvf cygwin32_ipc−1.03.tgz
3. cd cygwin32_ipc−1.03/src and run 'make'
4. mkdir −p c:/usr/local/{bin,include,lib,include/sys}

```
cp /cygwin32_ipc−1.03/bin/* c:/usr/local/bin
cp /cygwin32_ipc−1.03/include/sys/* c:/usr/local/include/sys
cp /cygwin32_ipc−1.03/lib/* c:/usr/local/lib
cp c:/usr/local/bin/* /bin
cp c:/Unix/Root/cygwin−b20/H−i586−cygwin32/bin/* /bin
```

5. mount c:/usr/local/bin /usr/local/bin

```
mount c:/usr/local/include /usr/local/include
mount c:/usr/local/lib /usr/local/lib
cp /local/lib/* /usr/local/lib
```

21.5 Install PostgreSQL

1. Download the latest PostgreSQL source code
2. Postgres treats all files as binary files so the lf/cf stuff appeard, so we do steps 2, 3, 4, and 5:

```
mkdir −p c:/Postgres/{Source,Binary}
mkdir c:/Postgres/Binary/pgsql
mkdir −p /usr/src/pgsql
mkdir −p /usr/local/pgsql
```

3. Copy Postgres source code to c:/Postgres/Source directory, then tar −zxvf postgresql−6.5.3.tar.gz
4. mv postgresql−6.5.3 pgsql
5. Mount directories now −

```
mount −b c:/Postgres/Binary/pgsql /usr/local/pgsql
mount c:/Postgres/Source/pgsql /usr/src/pgsql
mount c:/Unix/Root/cygwin−b20/share /sw/cygwin−b20/share
```

6. mkdir −p /usr/local/pgsql/{bin,include,lib,data}
7. cd /usr/src/pgsql/src/win32
8. Copy header files −

```
cp un.h c:/Unix/Root/cygwin−b20/H−i586−cygwin32/i586−cygwin32/include/sys
cp endian.h c:/Unix/Root/cygwin−b20/H−i586−cygwin32/i586−cygwin32/include
cp tcp.h c:/Unix/Root/cygwin−b20/H−i586−cygwin32/i586−cygwin32/include/netinet
```

9. ln −s /usr/local/lib /usr/src/pgsql/src/backend/libpostgres.a
10. cd /usr/src/pgsql/src, then run './configure'
11. make > make.txt 2>&1
12. make install > make.install.txt 2>&1
13. cp /usr/local/pgsql/lib/pq.dll /usr/local/pgsql/bin
14. After the make install you had to change all the text files in the bin and lib diectories so that they did not contain cr/lf and eof stuff.
15. Using any editor to create .bashrc in / directory as belows:

```
PATH=$PATH:/usr/local/pgsql/bin:/usr/local/bin
PGDATA=/usr/local/pgsql/data
PGLIB=/usr/local/pgsql/lib
LD_LIBRARY_PATH=/usr/local/pgsql/lib:/usr/local/lib
export LD_LIBRARY_PATH PATH PGDATA PGLIB
```

16. source /.bashrc, then run 'initdb −−username=xxxx' Note that the owner of the DB system have to be different from root/administrator
17. Edit the file /usr/local/pgsql/data/pg_hba.conf, such as:

```
host        all     163.17.11.109   255.255.255.0   trust
```

18. ipc−daemon.exe&
19. postmaster −i&
20. Run ' psql −h host_name template1'

22.Mailing Lists

22.1 E−mail account for PostgreSQL

Get free e−mail accounts from

- In Yahoo http://www.yahoo.com click on e−mail
- In Lycos http://www.lycos.com click on new e−mail accounts
- In hotmail http://www.hotmail.com click on new e−mail accounts

Subscribe to PostgreSQL mailing list and Yahoo has additional feature of creating a seperate folder for PostgreSQL e−mails, so that your regular e−mail is not cluttered. Select menu Email− > Options− > Filters and pick seperate folder for email. With this e−mail account you can access mail from anywhere in the world as long as you have access to a web page.

If you have any other e−mail, you can use "Mail Filters" to receive automatically the PostgreSQL mails into a seperate folder. This will avoid mail cluttering.

22.2 English Mailing List

See the Mailing Lists Item on the main web page at :

- http://www.postgresql.org/
- Email questions to: pgsql−questions@postgresql.org
- Developers pgsql−hackers@postgresql.org
- Port specific questions pgsql−ports@postgresql.org
- Documentation questions pgsql−docs@postgresql.org

You will get the answers/replies back by e−mail in less than a day.

You can also subscribe to mailing lists. To subscribe or unsubscribe from the list, send mail to

- pgsql−questions−request@postgresql.org
- pgsql−hackers−request@postgresql.org
- pgsql−ports−request@postgresql.org
- pgsql−docs−request@postgresql.org

The body of the message should contain the single line

subscribe

(or)

unsubscribe

22.3 Archive of Mailing List

Also mailing lists are archived in html format at the following location −

- Date−wise listing available via MHonarc via the WWW at http://www.postgresql.org/mhonarc/pgsql−questions
- ftp://ftp.postgresql.org directory is /pub/majordomo

There is also search engine available on the PostgreSQL main web site specifically for pgsql questions.

22.4 Spanish Mailing List

Now there is an "unofficial" list of postgreSQL in Spanish. To subscribe the user has to send a message to:

- majordomo@tlali.iztacala.unam.mx

The body of the message should contain the single line:

inscripcion pgsql−ayuda

---

23. Documentation and Reference Books

23.1 User Guides and Manuals

The following are included in the PostgreSQL distribution in the postscript, HTML formats and unix man−pages. They are located in /usr/doc/postgresql* directory. If you have access to internet, you can find the documents listed below at http://www.postgresql.org/docs

- "Installation Guide"
- "User Guide" for PostgreSQL
- "Implementation Guide" detailing database internals of PostgreSQL.
- Online manuals.
- Online manuals in HTML formats.
- Also manuals in Postscript format for printing hard copies.

23.2 Online Documentation

- Listing and description of default data types and operators

```
Is a a part of PSQL command
```

- Listing of supported SQL keywords

```
There is a script in the /tools directory in source code tree.
```

- Listings of supported statements −

```
Use the command psql \h
```

- Basic relational database concepts under PostgreSQL (implementation) and several online examples (queries) −

```
Look at the regression tests at src/test. There you can find the directories
regress/sql and suite/*.sql and also see <ref id="Examples RPM">
```

- Tutorial for PostgreSQL.

```
SQL tutorial scripts is in the directory src/tutorial

23.4 ANSI/ISO SQL Specifications documents − SQL 1992, SQL 1998

ANSI/ISO SQL specifications documents can be found at these sites listed below −

- http://www.naiua.org/std−orgs.html
- http://www.ansi.org/docs and click on file cat_c.html and search with "Database SQL"
- SQL92 standard http://www.jcc.com and click on file sql_stnd.html
- ANSI/ISO SQL specifications http://www.contrib.andrew.cmu.edu/~shadow/sql.html You will find SQL Reference here.

23.5 Syntax of ANSI/ISO SQL 1992

See Appendix A of this document Appendix A

23.6 Syntax of ANSI/ISO SQL 1998

The SQL 1998 (SQL 3) specification is still under development. See 'Electronic Access to the SQL3 Working Draft' of this document at SQL 1998

23.7 SQL Tutorial for beginners

23.8 Temporal Extension to SQL92

- Document for Temporal Extension to SQL−92 ftp://FTP.cs.arizona.edu/tsql/tsql2/
- Temporal SQL−3 specification ftp://FTP.cs.arizona.edu/tsql/tsql2/sql3/

This directory contains the language specification for a temporal extension to the SQL−92 language standard. This new language is designated TSQL2.

The language specification present here is the final version of the language.

Correspondence may be directed to the chair of the TSQL2 Language Design Committee, Richard T.Snodgrass, Department of Computer Science, University of Arizona, Tucson, AZ 85721,

- rts@cs.arizona.edu

The affiliations and e−mail addresses of the TSQL2 Language Design Committee members may be found in a separate section at the end of the language specification.

The contents of this directory are as follows.

spec.dvi,.ps TSQL2 Language Specification, published in September, 1994

bookspec.ps TSQL2 Language Specification, as it appears in the TSQL2 book, published in September, 1995 (see below).

sql3 change proposals submitted to the ANSI and ISO SQL3 committees.

Associated with the language specification is a collection of commentaries which discuss design decisions, provide examples, and consider how the language may be implemented. These commentaries were originally proposals to the TSQL2 Language Design Committee. They now serve a different purpose: to provide examples of the constructs, motivate the many decisions made during the language design, and compare TSQL2 with the many other language proposals that have been made over the last fifteen years. It should be emphasized that these commentaries are not part of the TSQL2 language specification per se, but rather supplement and elaborate upon it. The language specification proper is the final word on TSQL2.

The commentaries, along with the language specification, several indexes, and other supporting material, has been published as a book:

Snodgrass, R.T., editor, The TSQL2 Temporal Query Language, Kluwer Academic Publishers, 1995, 674+xxiv pages.

The evaluation commentary appears in the book in an abbreviated form; the full commentary is provided in this directory as file eval.ps

The file tl2tsql2.pl is a prolog program that tranlates allowed temporal logic to TSQL2. This program was written by Michael Boehlen

- boehlen@iesd.auc.dk

He may be contacted for a paper that describes this translation. This is a rather dated version of that program. Newer versions are available at

- http://www.cs.auc.dk/general/DBS/tdb/TimeCenter/Software

(the TimeDB and Tiger systems).

23.9 Part 0 − Acquiring ISO/ANSI SQL Documents

This document shows you how to (legally) acquire a copy of the SQL−92 standard and how to acquire a copy of the "current" SQL3 Working Draft.

The standard is copyrighted ANSI standard by ANSI, the ISO standard by ISO.

There are two (2) current SQL standards, an ANSI publication and an ISO publication. The two standards are word−for−word identical except for such trivial matters as the title of the document, page headers, the phrase "International Standard" vs "American Standard", and so forth.

Buying the SQL−92 Standard

The ISO standard, ISO/IEC 9075:1992, Information Technology − Database Languages − SQL, is currently (March, 1993) available and in stock from ANSI at:

```
American National Standards Institute
1430 Broadway
New York, NY 10018 (USA)
Phone (sales): +1.212.642.4900
```

at a cost of US$230.00. The ANSI version, ANSI X3.135−1992, American National Standard for Information Systems − Database Language SQL, was not available from stock at this writing, but was expected to be available by some time between late March and early May, 1993). It is expected to be be priced at US$225.00.

If you purchase either document from ANSI, it will have a handling charge of 7% added to it (that is, about US$9.10). Overseas shipping charges will undoubtedly add still more cost. ANSI requires a hardcopy of a company purchase order to accompany all orders; alternately, you can send a check drawn on a US bank in US dollars, which they will cash and clear before shipping your order. (An exception exists: If your organization is a corporate member of ANSI, then ANSI will ship the documents and simply bill your company.)

The ISO standard is also available outside the United States from local national bodies (country standardization bodies) that are members of either ISO (International Organization for Standardization) or IEC (International Electrotechnical Commission). Copies of the list of national bodies and their addresses are available from ANSI or from other national bodies. They are also available from ISO:

```
International Organization for Standardization
Central Secretariat
1, rue de Varembi
CH−1211 Genhve 20
Switzerland
```

If you prefer to order the standard in a more convenient and quick fashion, you'll have to pay for the privilege. You can order ISO/IEC 9075:1992, Information Technology − Database Languages − SQL, from:

```
Global Engineering Documents
2805 McGaw Ave
Irvine, CA 92714 (USA)
USA
Phone (works from anywhere): +1.714.261.1455
Phone (only in the USA): (800)854−7179
```

for a cost of US$308.00. I do not know if that includes shipping or not, but I would guess that international shipping (at least) would cost extra. They will be able to ship you a document fairly quickly and will even accept "major credit cards". Global does not yet have the ANSI version nor do they have a price or an expected date (though I would expect it within a few weeks following the publication by ANSI and at a price near US$300.00).

Buying a copy of the SQL3 Working Draft

You can purchase a hardcopy of the SQL3 working draft from the ANSI X3 Secretariat, CBEMA (Computer and Business Equipment Manufacturers Association). They intend to keep the "most recent" versions of the SQL3 working draft available and sell them for about US$60.00 to US$65.00. You can contact CBEMA at:

```
CBEMA, X3 Secretariat
Attn: Lynn Barra
1250 Eye St.
Suite 200
Washington, DC 20005 (USA)
```

Lynn Barra can also be reached by telephone at +1.202.626.5738 to request a copy, though mail is probably more courteous.

Electronic Access to the SQL3 Working Draft

The most recent version (as of the date of this writing) of the SQL3 (both ANSI and ISO) working draft (and all of its Parts) is available by "anonymous ftp" or by "ftpmail" on:

```
gatekeeper.dec.com
```

at

```
/pub/standards/sql/
```

In this directory are a number of files. There are PostScript. files and "plain text" (not prettily formatted, but readable on a screen without special software).

In general, you can find files with names like:

```
sql−bindings−mar94.ps
sql−bindings−mar94.txt
sql−cli−mar94.ps
sql−cli−mar94.txt
sql−foundation−mar94.ps
sql−foundation−mar94.txt
sql−framework−mar94.ps
sql−framework−mar94.txt
sql−psm−mar94.ps
sql−psm−mar94.txt
```

As new versions of the documents are produced, the "mar94" will change to indicate the new date of publication (e.g., "aug94" is the expected date of the next publication after "mar94").

In addition, for those readers unable to get a directory listing by FTP, we have placed a file with the name:

```
ls
```

into the same directory. This file (surprise!) contains a directory listing of the directory.

Retrieving Files Directly Using ftp

This is a sample of how to use FTP. Specifically, it shows how to connect to gatekeeper.dec.com, get to the directory where the base document is kept, and transfer the document to your host. Note that your host must have Internet access to do this. The login is 'ftp' and the password is your email address (this is sometimes referred to as 'anonymous ftp'). The command 'type binary' is used to ensure that no bits are stripped from the file(s) received. 'get' gets one file at a time. Comments in the script below are inside angle brackets < like so > .

```
% ftp gatekeeper.dec.com

Retrieving Files Without Direct ftp Support

Digital Equipment Corporation, like several other companies, provides ftp email service. The response can take several days, but it does provide a service equivalent to ftp for those without direct Internet ftp access. The address of the server is:

ftpmail@decwrl.dec.com

The following script will retrieve the PostScript for the latest version of the SQL3 document:

```
reply joe.programmer@imaginary−corp.com
connect gatekeeper.dec.com anonymous
binary
compress
```

The following script will retrieve the PostScript for the latest version of the SQL3 document:

```
reply joe.programmer@imaginary−corp.com
connect gatekeeper.dec.com anonymous
binary
compress
uuencode
chdir /pub/standards/sql
get x3h2−93−091.ps
quit
```

The first line in the script commands the server to return the requested files to you; you should replace "joe.programmer@imaginary−corp.com" with your Internet address. The file in this example, x3h2−93−091.ps, is returned in "compress"ed "uuencode"d format as 34 separate email messages. If your environment does not provide tools for reconstructing such files, then you could retrieve the file as plain text with the following script:

```
reply joe.programmer@imaginary−corp.com
connect gatekeeper.dec.com anonymous
chdir /pub/standards/sql
get x3h2−93−091.ps
quit
```

But be warned, the .ps file will probably be sent to you in more than 70 parts!

To retrieve any particular file, other than x3h2−93−091.ps, simply replace "x3h2−93−091.ps" with the name of the desired file. To get a directory listing of all files available, replace "get x3h2−93−091.ps" with "dir".

23.10 Part 1 − ISO/ANSI SQL Current Status

This chapter is a source of information about the SQL standards process and its current state.

Current Status:

Development is currently underway to enhance SQL into a computationally complete language for the definition and management of persistent, complex objects. This includes: generalization and specialization hierarchies, multiple inheritance, user defined data types, triggers and assertions, support for knowledge based systems, recursive query expressions, and additional data administration tools. It also includes the specification of abstract data types (ADTs), object identifiers, methods, inheritance, polymorphism, encapsulation, and all of the other facilities normally associated with object data management.

In the fall of 1996, several parts of SQL3 went through a ISO CD ballot. Those parts were SQL/Framework, SQL/Foundation, and SQL/Bindings. Those ballots failed (as expected) with 900 or so comments. In Late January, there was an ISO DBL editing meeting that processed a large number of problem solutions that were either included with ballot comments or submitted as separate papers. Since the DBL editing meeting was unable to process all of the comments, the editing meeting has been extended. The completion of the editing meeting is scheduled for the end of July, 1997, in London.

Following the July editing meeting, the expectation is that a Final CD ballot will be requested for these parts of SQL. The Final CD process will take about 6 months and a DBL editing meeting, after which there will be a DIS ballot and a fairly quick IS ballot.

The ISO procedures have changed since SQL/92, so the SQL committees are still working through the exact details of the process.

If everything goes well, these parts of SQL3 will become an official ISO/IEC standard in late 1998, but the schedule is very tight.

In 1993, the ANSI and ISO development committees decided to split future SQL development into a multi−part standard. The Parts are:

- Part 1: Framework A non−technical description of how the document is structured.
- Part 2: Foundation The core specification, including all of the new ADT features.
- Part 3: SQL/CLI The Call Level Interface.
- Part 4: SQL/PSM The stored procedures specification, including computational completeness.
- Part 5: SQL/Bindings The Dynamic SQL and Embedded SQL bindings taken from SQL−92.
- Part 6: SQL/XA An SQL specialization of the popular XA Interface developed by X/Open
- Part 7:SQL/TemporalAdds time related capabilities to the SQL standards.

In the USA, the entirety of SQL3 is being processed as both an ANSI Domestic ("D") project and as an ISO project. The expected time frame for completion of SQL3 is currently 1999.

The SQL/CLI and SQL/PSM are being processed as fast as possible as addendums to SQL−92. In the USA, these are being processed only as International ("I") projects. SQL/CLI was completed in 1995. SQL/PSM should be completed sometime in late 1996.

In addition to the SQL3 work, a number of additional projects are being persued:

- SQL/MM An ongoing effort to define standard multi−media packages using the SQL3 ADT capabilities.
- Remote Data Access (RDA)

Standards Committee and Process

There are actually a number of SQL standards committees around the world. There is an international SQL standards group as a part of ISO. A number of countries have committees that focus on SQL. These countries (usually) send representatives to ISO/IEC JTC1/SC 21/WG3 DBL meetings. The countries that actively participate in the ISO SQL standards process are:

- Australia
- Brazil
- Canada
- France
- Germany
- Japan
- Korea
- The Netherlands
- United Kingdom
- United States

NIST Validation

SQL implementations are validated (in the Unites States) by the National Institute of Standards and Training (NIST). NIST currently has a validation test suite for entry level SQL−92. The exact details of the NIST validation requirements are defined as a Federal Information Processing Standard (FIPS). The current requirements for SQL are defined in FIPS 127−2. The Postscript and Text versions of this document can be retrieved from NIST. The current SQL Validated Products List can also be retrieved from NIST.

Standard SQL Publications and Articles

There are two versions of the SQL standard. Both are available from ANSI:

- ISO/IEC 9075:1992, "Information Technology −−− Database Languages −−− SQL"
- ANSI X3.135−1992, "Database Language SQL"

The two versions of the SQL standard are identical except for the front matter and references to other standards. Both versions are available from:

```
American National Standards Institute
```

```
1430 Broadway
New York, NY 10018
USA
Phone (sales): +1.212.642.4900
```

In additon to the SQL−92 standard, there is now a Technical Corrigendum (bug fixes):

```
* Technical Corrigendum 1:1994 to ISO/IEC 9075:1992
```

TC 1 should also be available from ANSI. There is only an ISO version of TC 1 −− it applies both to the ISO and ANSI versions of SQL−92.

In addition to the standards, several books have been written about the 1992 SQL standard. These books provide a much more readable description of the standard than the actual standard.

Related Standards

A number of other standards are of interest to the SQL community. This section contains pointers to information on those efforts. These pointers will be augmented as additional information becomes available on the web.

- SQL Environments (FIPS 193)
- Next Generation Repository Systems (X3H4) − a News Release calling for particpation in "Developing Standards for the Next Generation Repository Systems."

23.11 Part 2 − ISO/ANSI SQL Foundation

A significant portion of the SQL3 effort is in the SQL Foundation document:

- Base SQL/PSM capabilities (moved form SQL/PSM−92)
- New data types
- Triggers
- Subtables
- Abstract Data Types (ADT)
- Object Oriented Capabilities

There are several prerequisites to the object oriented capabilities:

- Capability of defining complex operations
- Store complex operations in the database
- External procedure calls - Some operations may not be in SQL, or may require external interactions

These capabilities are defined as a part of SQL/PSM

A great deal of work is currently being done to refine the SQL−3 object model and align it with the object model proposed by ODMG. This effort is described in the X3H2 and ISO DBL paper: Accomodating SQL3 and ODMG. A recent update on the SQL3/OQL Merger is also available.

SQL3 Timing

Work on SQL3 is well underway, but the final standards is several years away.

- International ballot to progress SQL3 Foundation from Working Draft to Committee Draft (CD) taking place fall, 1996.
- Ballot is expected to generate numerous comments
- A second CD ballot is likely to be required
- Draft International Standard ballot is likely to be take place in mid 1998
- International Standard could be completed by mid 1999.

The ANSI version of the standard will be on a similar schedule.

23.12 Part 3 − ISO/ANSI SQL Call Level Interface

The SQL/CLI is a programing call level interface to SQL databases. It is designed to support database access from shrink−wrapped applications. The CLI was originally created by a subcommittee of the SQL Access Group (SAG). The SAG/CLI specification was published as the Microsoft Open DataBase Connectivity (ODBC) specification in 1992. In 1993, SAG submitted the CLI to the ANSI and ISO SQL committees. (The SQL Access Group has now merged with X/Open consortium.)

SQL/CLI provides an international standard for:

- Implementation−independent CLI to access SQL databases
- Client−server tools can easily access database through dynamic Link Libraries
- Supports and encourages rich set of Client−server tools

SQL/CLI Timing

For the standards process, SQL/CLI is being processed with blinding speed.

- SQL/CLI is an addendum to 1992 SQL standard (SQL−92)
- Completed as an ISO standard in 1995
- ISO/IEC 9075−3:1995 Information technology −− Database languages −− SQL −− Part 3: Call−Level Interface (SQL/CLI)
- Current SQL/CLI effort is adding support for SQL3 features

23.13 Part 4 − ISO/ANSI SQL Persistent Stored Modules

SQL/PSM expands SQL by adding:

- Procedural language extensions
- Multi−statement and Stored Procedures
- External function and procedure calls

In addition to being a valuable application development tool, SQL/PSM provides the foundation support for the object oriented capabilities in SQL3.

Multi−statement and Stored Procedures

Multi−statement and stored procedures offer a variety of advantages in a client/server environment:

- Performance − Since a stored procedure can perform multiple SQL statements, network interaction with the client are reduced.
- Security − A user can be given the right to call a stored procedure that updates a table or set of tables but denied the right to update the tables directly
- Shared code − The code in a stored procedure does not have to be rewritten and retested for each client tool that accesses the database.
- Control − Provides a single point of definition and control for application logic.

Procedural Language Extensions

Procedural language add the power of a traditional programming language to SQL through flow control statements and a variety of other programming constructs.

Flow Control Statements

- If−then−else
- Looping constructs
- Exception handling
- Case statement
- Begin−End blocks

The procedural language extensions include other programming language constructs:

- Variable declarations
- Set statements for value assignment
- Get diagnostics for process and status information

In addition, all of the traditional SQL statements can be included in multi−statement procedures.

External Procedure and Function Calls

One feature frequently mentioned in the wish lists for many database products, and implemented in some, is a capability augmenting the built−in features with calls to user−written procedures external to the database software.

- Allows a particular site or application to add their own database functions
- Can be used throughout the database applications

The benefit of this capability is that it gives the database (and therefore database applications) access to a rich set of procedures and functions too numerous to be defined by a standards committee.

SQL/PSM Timing

SQL/PSM is proceeding quickly:

- SQL/PSM is an addendum to SQL−92
- International ballot to progress SQL/PSM from a Draft International Standard to an International Standard ended January, 1996.
- Editing meeting in May, 1996 did not resolve all of the comments
- Continuation of PSM Editing meeting is scheduled for September 30 through October 4, 1996
- The schedule is tight but there is a chance that PSM will be published with a 1996 date.
- The official designation will be: ISO/IEC DIS 9075−4:199? Information technology −− Database languages −− SQL −− Part 4: SQL Persistent Stored Modules (SQL/PSM)
- Work is well underway on adding SQL/PSM support for SQL3 features.

23.14 Part 5 − ISO/ANSI SQL/Bindings

For ease of reference, the programming language bindings have been pulled out into a separate document. The current version is simply an extract of the dynamic and embedded bindings from SQL−92.

A variety of issues remain unresolved for the programming language bindings.

For traditional programming language, mappings exist for the SQL−92 datatypes. However, mappings must be defined between SQL objects and programming language variables.

For object oriented languages, mapping must be defined for the current SQL datatypes and between the SQL object model and the object model of the object−oriented language.

The object model needs to stabilize before these can be addressed.

The language bindings will be completed as a part of SQL3.

23.15 Part 6 − ISO/ANSI SQL XA Interface Specialization (SQL/XA)

This specification would standardize an application program interface (API) between a global Transaction Manager and an SQL Resource Manager. It would standardize the function calls, based upon the semantics of ISO/IEC 10026, "Distributed Transaction Processing", that an SQL Resource Manager would have to support for two−phase commit. The base document is derived from an X/Open publication, with X/Open permission, that specifies explicit input and output parameters and semantics, in terms of SQL data types, for the following functions: xa_close, xa_commit, xa_complete, xa_end, xa_forget, xa_open, xa_prepare, xa_recover, xa_rollback, and xa_start.

ISO is currently attempting to fast−track the X/Open XA specification. The fast−track process adopts a current industry specification with no changes. The XA fast−track ballot at the ISO SC21, JTC 1 level started on April 27, 1995 and ends on October 27, 1995. If the XA specification is approved by 75% of the votes, and by 2/3 of the p−members of JTC 1, it will become an International Standard. If the fast−track ballot is approved, SQL/XA could become a standard in 1996.

23.16 Part 7 − ISO/ANSI SQL Temporal

Temporal SQL deals with time−related data. The concept is that it is useful to query data to discover what it looked like at a particular point in time. Temporal SQL is a December, 1994 paper by Rick Snodgrass describing the concepts.

X3 Announces the Approval of a New Project, ISO/IEC 9075 Part 7: SQL/Temporal is a press release related to SQL/Temporal.

```
_____________________________________________________________________________
                                Temporal SQL

```

Several people have questioned the need for additional support for time in SQL3 (as proposed by DBL RIO−75, requesting a new part of SQL to support temporal databases). The claim is that abstract data types (ADT's) are sufficient for temporal support. In this informational item, I argue, using concrete examples, that using columns typed with abstract data types is inadequate for temporal queries. In particular, many common temporal queries are either difficult to simulate in SQL, or require embedding SQL in a procedural language. Alternatives are expressed in TSQL2, a temporal extension to SQL−92.

INTRODUCTION

Valid−time support goes beyond that of a temporal ADT. With the later, a column is specified as of a temporal domain, such as DATE or INTERVAL (examples will be given shortly). With valid time, the rows of a table vary over time, as reality changes. The timestamp associated with a row of a valid−time table is interpreted by the query language as the time when the combination of values of the columns in the row was valid. This implicit timestamp allows queries to be expressed succinctly and intuitively.

A CASE STUDY − STORING CURRENT INFORMATION

The University of Arizona's Office of Appointed Personnel has some information in a database, including each employee's name, their current salary, and their current title. This can be represented by a simple table.

```
Employee(Name, Salary, Title)
```

Given this table, finding an employee's salary is easy.

```
SELECT Salary
FROM Employee
WHERE Name = 'Bob'
```

Now the OAP wishes to record the date of birth. To do so, a column is added to the table, yielding the following schema.

```
Employee(Name, Salary, Title, DateofBirth DATE)
```

Finding the employee's date of birth is analogous to determining the salary.

```
SELECT DateofBirth
FROM Employee
WHERE Name = 'Bob'
```

A CASE STUDY − STORING HISTORY INFORMATION

The OAP wishes to computerize the employment history. To do so, they append two columns, one indicating when the information in the row became valid, the other indicating when the information was no longer valid.

Employee (Name, Salary, Title, DateofBirth, Start DATE, Stop DATE)

To the data model, these new columns are identical to DateofBirth. However, their presence has wide−ranging consequences.

A CASE STUDY − PROJECTION

To find an employee's current salary, things are more difficult.

```
SELECT Salary
FROM Employee
WHERE Name = 'Bob' AND Start <= CURRENT_DATE AND CURRENT_DATE <= Stop
```

This query is more complicated than the previous one. The culprit is obviously the two new columns. The OAP wants to distribute to each employee their salary history. Specifically, for each person, the maximal intervals at each salary needs to be determined. Unfortunately, this is not possible in SQL. An employee could have arbitrarily many title changes between salary changes.

```
Name    Salary  Title             DateofBirth   Start          Stop
----    ------  -----             -----------   -----          ----
Bob     60000   Assistant Provost 1945−04−09    1993−01−01     1993−05−30
Bob     70000   Assistant Provost 1945−04−09    1993−06−01     1993−09−30
Bob     70000   Provost           1945−04−09    1993−10−01     1994−01−31
Bob     70000   Professor         1945−04−09    1994−02−01     1994−12−31
```

Figure 1

Note that there are three rows in which Bob's salary remained constant at $70,000. Hence, the result should be two rows for Bob.

```
Name    Salary  Start          Stop
----    ------  -----          ----
Bob     60000   1993−01−01     1993−05−30
Bob     70000   1993−06−01     1994−12−31
```

One alternative is to give the user a printout of Salary and Title information, and have user determine when his/her salary changed. This alternative is not very appealing or realistic. A second alternative is to use SQL as much as possible.

```
CREATE TABLE Temp(Salary, Start, Stop)
AS      SELECT Salary, Start, Stop
        FROM Employee;
```

repeat

```
        UPDATE Temp T1
        SET (T1.Stop) = (SELECT MAX(T2.Stop)
                         FROM Temp AS T2
                         WHERE T1.Salary = T2.Salary AND T1.Start < T2.Start
                               AND T1.Stop >= T2.Start AND T1.Stop < T2.Stop)
        WHERE EXISTS (SELECT *
                      FROM Temp AS T2
                      WHERE T1.Salary = T2.Salary AND T1.Start < T2.Start
                               AND T1.Stop >= T2.Start AND T1.Stop < T2.Stop)
        until no rows updated;

DELETE FROM Temp T1

WHERE EXISTS (SELECT *
              FROM Temp AS T2
              WHERE T1.Salary = T2.Salary
                        AND ((T1.Start > T2.Start AND T1.Stop <= T2.Stop)
                        OR (T1.Start >= T2.Start AND T1.Stop < T2.Stop))
```

The loop finds those intervals that overlap or are adjacent and thus should be merged. The loop is executed log N times in the worst case, where N is the number of rows in a chain of overlapping or adjacent value−equivalent rows. The reader can simulate the query on the example table to convince him/herself of its correctness.

A third alternative is to use SQL only to open a cursor on the table. A linked list of periods is maintained, each with a salary. This linked list should be initialized to empty.

```
DECLARE emp_cursor CURSOR FOR
        SELECT Salary, Title, Start, Stop
        FROM Employee;
OPEN emp_cursor;
loop:
        FETCH emp_cursor INTO :salary, :start, :stop;
        if no−data returned then goto finished;
        find position in linked list to insert this information;
        goto loop;
finished:
CLOSE emp_cursor;
```

iterate through linked list, printing out dates and salaries

The linked list may not be necessary in this case if the cursor is ORDER BY Start.

In any case, the query, a natural one, is quite difficult to express using the facilities present in SQL−92. The query is trivial in TSQL2.

```
        SELECT Salary
        FROM Employee
```

A CASE STUDY − JOIN

A more drastic approach is to avoid the problem of extracting the salary history by reorganizing the schema to separate salary, title, and date of birth information (in the following, we ignore the date of birth, for simplicity).

```
Employee1 (Name, Salary, Start DATE, Stop DATE)
Employee2 (Name, Title, Start DATE, Stop DATE)
```

The Employee1 table is as follows.

```
Name    Salary  Start           Stop
----    ------  -----           ----
Bob     60000   1993−01−01      1993−05−30
Bob     70000   1993−06−01      1993−12−31
```

Here is the example Employee2 table.

```
Name    Title                   Start           Stop
----    ------                  -----           ----
Bob     Assistant Provost       1993−01−01      1993−09−30
Bob     Provost                 1993−10−01      1994−01−31
Bob     Professor               1994−02−01      1994−12−31
```

With this change, getting the salary information for an employee is now easy.

```
SELECT Salary, Start, Stop
FROM Employee1
WHERE Name = 'Bob'
```

But what if the OAP wants a table of salary, title intervals (that is, suppose the OAP wishes a table to be computed in the form of Figure 1)? One alternative is to print out two tables, and let the user figure out the combinations. A second alternative is to use SQL entirely. Unfortunately, this query must do a case analysis of how each row of Employee1 overlaps each row of Employee2; there are four possible cases.

```
SELECT Employee1.Name, Salary, Dept, Employee1.Start, Employee1.Stop
FROM Employee1, Employee2
WHERE Employee1.Name = Employee2.Name
     AND Employee2.Start <= Employee1.Start AND Employee1.Stop < Employee2.Stop
UNION
SELECT Employee1.Name, Salary, Dept, Employee1.Start, Employee2.Stop
FROM Employee1, Employee2
WHERE Employee1.Name = Employee2.Name
     AND Employee1.Start >= Employee2.Start AND Employee2.Stop < Employee1.Stop
        AND Employee1.Start < Employee2.Stop
UNION
SELECT Employee1.Name, Salary, Dept, Employee2.Start, Employee1.Stop
FROM Employee1, Employee2
WHERE Employee1.Name = Employee2.Name
     AND Employee2.Start > Employee1.Start AND Employee1.Stop < Employee2.Stop
        AND Employee2.Start < Employee1.Stop
UNION
```

```
SELECT Employee1.Name, Salary, Dept, Employee2.Start, Employee2.Stop
FROM Employee1, Employee2
WHERE Employee1.Name = Employee2.Name
     AND Employee2.Start > Employee1.Start AND Employee2.Stop < Employee1.Stop
```

Getting all the cases right is a challenging task. In TSQL2, performing a temporal join is just what one would expect.

```
SELECT Employee1.Name, Salary, Dept
FROM Employee1, Employee2
WHERE Employee1.Name = Employee2.Name
```

A CASE STUDY − AGGREGATES

Now the OAP is asked, what is the maximum salary? Before adding time, this was easy.

```
SELECT MAX(Salary)
FROM Employee
```

Now that the salary history is stored, we'd like a history of the maximum salary over time. The problem, of course, is that SQL does not provide temporal aggregates. The easy way to do this is to print out the information, and scan manually for the maximums. An alternative is to be tricky and convert the snapshot aggregate query into a non−aggregate query, then convert that into a temporal query. The non−aggregate query finds those salaries for which a greater salary does not exist.

```
SELECT Salary
FROM Employee AS E1
WHERE NOT EXISTS (SELECT *
                  FROM Employee AS E2
                  WHERE E2.Salary > E1.Salary)
```

Converting this query into a temporal query is far from obvious. The following is one approach.

```
CREATE TABLE Temp (Salary, Start, Stop)
AS      SELECT Salary, Start, Stop
        FROM Employee;
INSERT INTO Temp
        SELECT T.Salary, T.Start, E.Start
        FROM Temp AS T, Employee AS E
        WHERE E.Start >= T.Start AND E.Start < T.Stop AND E.Salary > T.Salary;

INSERT INTO Temp
        SELECT T.Salary, T.Stop, E.Stop
        FROM Temp AS T, Employee AS E
        WHERE E.Stop > T.Start AND E.Stop <= T.Stop AND E.Salary > T.Salary;
DELETE FROM Temp T
WHERE EXISTS (SELECT *
              FROM Employee AS E
              WHERE ((T.Start => E.Start AND T.Start < E.Stop)
                        OR (E.Start >= T.Start AND E.Start < T.Stop))
                    AND E.Salary > T.Salary;
```

This approach creates an auxiliary table. We add to this table the lower period of a period subtraction and the upper period of a period subtraction. We then delete all periods that overlap with some row defined by the subquery, thereby effecting the NOT EXISTS. Finally we generate from the auxiliary table maximal periods, in the same way that the salary information was computed above. As one might imagine, such SQL code is extremely inefficient to execute, given the complex nested queries with inequality predicates.

A third alternative is to use SQL as little as possible, and instead compute the desired maximum history in a host language using cursors.

The query in TSQL2 is again straightforward and intuitive.

```
SELECT MAX(Salary)
FROM Employee
```

SUMMARY

Time−varying data is manipulated in most database applications. Valid−time support is absent in SQL. Many common temporal queries are either difficult to simulate in SQL, or require embedding SQL in a procedural language, due to SQL's lack of support for valid−time tables in its data model and query constructs.

Elsewhere, we showed that adding valid−time support requires few changes to the DBMS implementation, can dramatically simplify some queries and enable others, and can later enable optimizations in storage structures, indexing methods, and optimization strategies that can yield significant performance improvements.

With a new part of SQL3 supporting time−varying information, we can begin to address such applications, enabling SQL3 to better manage temporal data.

−− Accredited Standards Committee X3, Information Technology is announcing the approval of a new project on SQL/Temporal Support, ISO/IEC 9075 Part 7, with the work being done in Technical Committee X3H2, Database. The scope of this proposed standard specifies a new Part of the emerging SQL3 standard, e.g., Part 7, Temporal SQL, to be extensions to the SQL language supporting storage, retrieval, and manipulation of temporal data in an SQL database environment. The next X3H2 meeting is scheduled for March 11−14, 1996 in Kansas.

Inquiries regarding this project should be sent to the

```
Chairman of X3H2,
Dr. Donald R. Deutsch,
Sybase, Inc., Suite 800,
6550 Rock Spring
Drive, Bethesda, MD  20817.
Email: deutsch@sybase.com.
```

An initial call for possible patents and other pertinent issues (copyrights, trademarks) is now being issued. Please submit information on these issues to the

```
X3 Secretariat at
1250 Eye Street
NW, Suite 200,
Washington DC  20005.

23.17 Part 8 − ISO/ANSI SQL MULTIMEDIA (SQL/MM)

A new ISO/IEC international standardization project for development of an SQL class library for multimedia applications was approved in early 1993. This new standardization activity, named SQL Multimedia (SQL/MM), will specify packages of SQL abstract data type (ADT) definitions using the facilities for ADT specification and invocation provided in the emerging SQL3 specification. SQL/MM intends to standardize class libraries for science and engineering, full−text and document processing, and methods for the management of multimedia objects such as image, sound, animation, music, and video. It will likely provide an SQL language binding for multimedia objects defined by other JTC1 standardization bodies (e.g. SC18 for documents, SC24 for images, and SC29 for photographs and motion pictures).

The Project Plan for SQL/MM indicates that it will be a multi−part standard consisting of an evolving number of parts. Part 1 will be a Framework that specifies how the other parts are to be constructed. Each of the other parts will be devoted to a specific SQL application package. The following SQL/MM Part structure exists as of August 1994:

- Part 1: Framework A non−technical description of how the document is structured.
- Part 2: Full Text Methods and ADTs for text data processing. About 45 pages.
- Part 3: Spatial Methods and ADTs for spatial data management. About 200 pages with active contributions from Spatial Data experts from 3 national bodies.
- Part 4: General Purpose Methods and ADTs for complex numbers, Facilities include trig and exponential functions, vectors, sets, etc. Currently about 90 pages.

There are a number of standards efforts in the area of Spatial and Geographic information:

- ANSI X3L1 − Geographic Information Systems. Mark Ashworth of Unisys is the liason between X3L1 and ANSI X3H2. He is also the editor for parts 1, 3, and 4 of the SQL/MM draft.
- ISO TC 211 − Geographic information/Geomatics

24.Technical support for PostgreSQL

If you have any technical question or encounter any problem you can e−mail to:

- pgsql−questions@postgresql.org
- Newsgroup comp.databases.postgresql.general
- Newsgroup comp.databases.postgresql.hackers
- Newsgroup comp.databases.postgresql.doc
- Newsgroup comp.databases.postgresql.bugs
- Newsgroup linux.postgres
- Other Mailing lists http://www.postgresql.org

and expect e−mail answer in less than a day. As the user−base of internet product is very vast, and users support other users, internet will be capable of giving technical support to billions of users easily. Email support is much more convenient than telephone support as you can cut and paste error messages, program output etc.. and easily transmit to mailing list/newsgroup.

Also PostgreSQL organisation is selling technical support to companies, the revenue generated will be used for maintaining several mirror sites (web and ftp) around the world. The revenue will also be used to produce printed documentation, guides, textbooks which will help the customers.

You can also take help from professional consulting firms like RedHat, Anderson, WGS (Work Group Solutions). Contact them for help, since they have very good expertise in "C", "C++" (PostgreSQL is written in "C") −

25.Economic and Business Aspects

Commercial databases pay many taxes like federal, state, sales, employment, social security, medicare taxes, health care for employees, bunch of benefits for employees, marketing and advertisement costs. All these costs do not go directly for the development of the database and do not improve the quality or technology of the database. When you buy a commercial database, some portion of the amount goes for overheads like taxes, expenses and balance for database R&D costs.

Also commercial databases have to pay for buildings/real−estates and purchase Unix machines, install and maintain them. All of these costs are passed onto customers.

PostgreSQL has the advantage over commercial databases as there is no direct taxes since it is made on the internet. A very vast group of people contribute to the development of the PostgreSQL. For example, in a hypothetical case, if there are one million companies in U.S.A and each contribute about $ 10 (worth of software to PostgreSQL) then each and every company will get ten million dollars!! This is the **GREAT MAGIC** of software development on internet.

Currently, PostgreSQL source code is about 2,50,000 lines of "C", "C++" code. If cost of each line of "C" code is $ 2 then the PostgreSQL is worth about $ 5,00,000 (half a million dollars!).

Many companies already develop in−house vast amount of "C", "C++" code. Hence by taking in the source code of PostgreSQL and collaborating with other companies on internet will greatly benefit the company saving time and efforts.

27.Internet World Wide Web Searching Tips

Internet is very vast and it has vast number of software and has a ocean of information underneath. It is growing at the rate of 300% annually world wide. It is estimated that there are about 10 million Web sites world wide!

To search for a information you would use search engines like "Yahoo", "Netscape", "Lycos" etc. Go to Yahoo, click on search. Use filtering options to narrow down your search criteria. The default search action is "Intelligent search" which is more general and lists all possiblities. Click on "Options" to select "EXACT phrase" search, "AND" search, "OR" search, etc.. This way you would find the information you need much faster. Also in the search menu, there are radio−buttons for searching in Usenet, Web−sites and Yahoo sites.

28.Conclusion

After researching all the available databases which are **free** and source code is available, it was found that ONLY PostgreSQL is the MOST mature, most widely used and robust RDBMS SQL free database (object relational) in the world.

PostgreSQL is very appealing since lot of work had already been done. It has ODBC and JDBC drivers, using these it is possible to write applications independent of the databases. The applications written in PostgreSQL using ODBC, JDBC drivers are easily portable to other databases like Oracle, Sybase and Informix and vice

versa.

You may ask "But why PostgreSQL ?" The answer is, since it takes lot more time to develop a database system from scratch, it makes sense to pick up a database system which satisfies the following conditions −

A database system

- Whose source code is available − Must be a 'Open Source Code' system
- Has no license strings, no ownership strings attached to it
- Which can be distributed on internet
- Which had been on development for several years.
- Which satisfies standards like ISO/ANSI SQL 92 (and SQL 89)
- Which can satisfy future needs like SQL 3 (SQL 98)
- Which has advanced capabilities

And it just happens to be 'PostgreSQL' which satisfies all these conditions and is an appropriate software for this situation. You may say 'PostgreSQL' is a very strange name. But my argument is − why change the name. This world is stuck with "PostgreSQL" forever!!

30.Other Formats of this Document

This document is published in 11 different formats namely − DVI, Postscript, Latex, Adobe Acrobat PDF, LyX, GNU−info, HTML, RTF(Rich Text Format), Plain−text, Unix man pages and SGML.

- You can get this HOWTO document as a single file tar ball in HTML, DVI, Postscript or SGML formats from − ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/other−formats/
- Plain text format is in: ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO
- Translations to other languages like French, German, Spanish, Chinese, Japanese are in ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO Any help from you to translate to other languages is welcome.

The document is written using a tool called "SGML tool" which can be got from − http://www.xs4all.nl/~cg/sgmltools/ Compiling the source you will get the following commands like

- sgml2html databasehowto.sgml (to generate html file)
- sgml2rtf databasehowto.sgml (to generate RTF file)
- sgml2latex databasehowto.sgml (to generate latex file)

This document is located at −

Also you can find this document at the following mirrors sites −

- http://www.caldera.com/LDP/HOWTO/PostgreSQL−HOWTO.html
- http://www.WGS.com/LDP/HOWTO/PostgreSQL−HOWTO.html
- http://www.cc.gatech.edu/linux/LDP/HOWTO/PostgreSQL−HOWTO.html
- http://www.redhat.com/linux−info/ldp/HOWTO/PostgreSQL−HOWTO.html
- Other mirror sites near you (network−address−wise) can be found at http://sunsite.unc.edu/LDP/hmirrors.html select a site and go to directory /LDP/HOWTO/PostgreSQL−HOWTO.html

In order to view the document in dvi format, use the xdvi program. The xdvi program is located in tetex−xdvi*.rpm package in Redhat Linux which can be located through ControlPanel | Applications | Publishing | TeX menu buttons. To read dvi document give the command −

```
xdvi −geometry 80x90 howto.dvi
man xdvi
```

And resize the window with mouse. To navigate use Arrow keys, Page Up, Page Down keys, also you can use 'f', 'd', 'u', 'c', 'l', 'r', 'p', 'n' letter keys to move up, down, center, next page, previous page etc. To turn off expert menu press 'x'.

You can read postscript file using the program 'gv' (ghostview) or 'ghostscript'. The ghostscript program is in ghostscript*.rpm package and gv program is in gv*.rpm package in Redhat Linux which can be located through ControlPanel | Applications | Graphics menu buttons. The gv program is much more user friendly than ghostscript. Also ghostscript and gv are available on other platforms like OS/2, Windows 95 and NT, you view this document even on those platforms.

- Get ghostscript for Windows 95, OS/2, and for all OSes from http://www.cs.wisc.edu/~ghost

To read postscript document give the command −

```
gv howto.ps
ghostscript howto.ps
```

CAUTION: This document is large, total number of pages (postscript) if printed will be approximately 113 pages.

You can read HTML format document using Netscape Navigator, Microsoft Internet explorer, Redhat Baron Web browser or any of the 10 other web browsers.

You can read the latex, LyX output using LyX a X−Windows front end to latex.
