Wearable–HOWTO.

Lionel, trollhunter Bouchpan–Lerust–Juéry
[<trollhunter@linuxfr.org>](mailto:trollhunter@linuxfr.org)

v0.0.7 March 2000

Nomadism is one of the major trends of our society, now most of the people can work with a laptop computer, but few did the next step: to live, or if you prefer to wear one computer that is a wearable.

, with the Front–Cover Texts being "title" and "abstract" , and with no Back–Cover Texts . A copy of the license is included in the section entitled "GNU Free Documentation License".

1.1 GNU Free Documentation Licence.

0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other written document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you".

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of

Wearable-HOWTO.

the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (For example, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, whose contents can be viewed and edited directly and straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup has been designed to thwart or discourage subsequent modification by readers is not Transparent. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML designed for human modification. Opaque formats include PostScript, PDF, proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

Wearable-HOWTO.

3. COPYING IN QUANTITY

If you publish printed copies of the Document numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications

Wearable-HOWTO.

- adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
 - G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
 - H. Include an unaltered copy of this License.
 - I. Preserve the section entitled "History", and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
 - J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
 - K. In any section entitled "Acknowledgements" or "Dedications", preserve the section's title, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
 - L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
 - M. Delete any section entitled "Endorsements". Such a section may not be included in the Modified Version.
 - N. Do not retitle any existing section as "Endorsements" or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties--for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

Wearable-HOWTO.

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections entitled "History" in the various original documents, forming one section entitled "History"; likewise combine any sections entitled "Acknowledgements", and any sections entitled "Dedications". You must delete all sections entitled "Endorsements."

6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a Modified Version of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an "aggregate", and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document's Cover Texts may be placed on covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include

Wearable-HOWTO.

translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

2.Foreword

I am not a guru in wearable computing, simply after some years using HP95LX and HP200LX palmtop computers more like wearables than like a PDA (thanks to DOS 5, the HP200LX even allowed me to do a semester CS project using turbo pascal while commuting in the subway), and living with a palm IIIx and a laptop running Linux, to me the next step is having a wearable running Linux, thus I have spent more than a year reading various informations on wearable and taking a little part in the wear-hard mailing list. As more and more people will be interested in the wearable concept I have decided to start this HOWTO in order to help them (At the time of this writing I am building my own wearable using my laptop (Toshiba 430CDT) with a twiddler keyboard, emacspeak, and camcorders batteries.)

Some people may, at least, be surprised to find the "In the army now" section so I would like to explain my position: I am trying to write this HOWTO both as a journalist and a scientist would do: this implies as a journalist to look for information from every source available, and as a scientist to be neutral: and as the US Army is willing to purchase more than 30.000 units one can hardly overlook this user group. This document is intended to be the starting point of a long term work. If you have any information (that can be checked)

that you think is of interest, do not hesitate contact me.

3. What is a Wearable anyway ?

Well, as its name implies a wearable is a computer you are supposed to wear, actually very few wearables fill this definition. On a more practical point of view one can define a wearable as a computer you can use on the run relying only on its power supply (see the power supply section for more information). So with such a definition PDAs, palmcomputers, customized laptops are wearables too. As Wearable computing is a new field, there is no standard definition for a Wearable computer, but you may find Professor Steve Mann's definition very . To me medical devices such as pacemakers too are Wearable computers and they don't fit in Professor Steve Mann's [definition](#) (actually Professor Steve Mann is one of the Pionneers in Wearable computing) On the Wearcomp website there is also a [FAQ](#) trying to define what a Wearable is.

I am not a specialist in wearables, simply I have a very strong interest in nomadic computing and I studying a lot its implementations both from a technical point of view and from the way nomadic computing is going to change our every day life and the way we interacts as we are getting more and more connected.

This text is included in the LINUX DOCUMENTATION PROJECT <http://www.linuxdoc.org/HOWTO> .

The latest version of this document is available in HTML format at <http://infonemade.linuxfr.org/Wearable–HOWTO.html>, you can retrieve the sgml format at <http://infonemade.linuxfr.org/Wearable–HOWTO.sgml>

I will maintain the French version too. If you wish to mirror it or to translate it, please contact me.

Lionel, Trollhunter Bouchpan–Lerust–Juéry <trollhunter@linuxfr.org> or at <boucli27@altavista.net>

4. Advocacy

Some people may want to know why you want to build a wearable or you may have to sell your idea to the people who are responsible for the purchase. Here are some ideas you may use.

4.1 Why ?

Because, you want to experiment by yourself, because you think that Human Computer Interaction is not a matter of designing the n–th windowmanager, because you feel that enhanced reality is the cutting edge of your evolution.

4.2 The Wearable concept is not a revolution, it is just an evolution.

Some people are afraid of revolutionary or so called products, thus the good news is that the wearable may look like a revolutionary concept but it is actually just an evolution of the computing hardware. Let me explain that : At first there was the Mainframe, then came the desktop computer enabling people to work in their office, latter the PC enabled these people to work at home too, as time passed the portable PC enabled people to work in a Hotel room, or everywhere they could find a power plug (yes an Osborne or an IBM's convertible were definitively not laptop computers), at the same time some pocket computers appeared on the market : Sharp PC1500, Canon X07, Casio PB100 then the first one weighted less and less, the second one disappeared but the LCD screen was, with other things their legacy allowing the laptop to emerge, as the laptop went mainstream, its size went smaller allowing people to work in the train, at the library ..., then palmtop PC's such as the HP95LX and PDA's appeared, (at this time the most successful is the PalmPilot family and its clones) allowing people to work on the move, so the wearable is just the next step in this move towards miniaturization. (If you want to learn more about Laptops and Linux you should read the Laptop–HOWTO, the latest version can be found at Werner's Heuser [Homepage](#))

4.3 The Wearable may give its user an edge.

In today's competitive world it is very important to get an edge over the other company, thus for example in a plane repair company the engineers who are using wearables do not waste time in asking for blueprints but instead have the blueprint and the technical data at will while performing their job, thus they will be able to repair the planes faster. You may choose an example in your job.

4.4 The Wearable concept: a stealth menace.

When they made their first appearance on the market, some products or technologies were, to say the least, less than perfect. This is a stealth menace, if you read Clayton Christensen's book "The innovator's dilemma: when new technologies cause great firms to fail" or Andy's Grove "Only the paranoid survives" you will see that some corporations that relies on a product and that have a king of the hill may fall down because they overlooked a new product/technology that was clumsy at its beginning and was at first in a market niche, then the contender took over the market.

4.5 Wearable computing: an emerging industry.

The people who decide to fund your project are not always very found about technical details, thus you will have to use other arguments, otherwise your pet project will be sent to /dev/null. If one reads again chapter 2 of AP Sloan's book: "My years with General Motors" it is obvious that the Wearable industry is going into the same changes as did the automobile industry in the US at the turn of the century : it turned from a Hobby with some small manufacturers to a mass market Industry. It took nearly 30 years to the automobile industry to change, but the wearable industry should have done this changes in less than 5 years, so if they don't invest on this product others will do.

5.What CPU ?

5.1 PDA based Wearables

Usually they use non Intel CPU (except the HP95/100/200LX) See the PalmPilot : a new breed of wearables section.

5.2 PC/104 and laptop based Wearables.

Theses devices are using usually an Intel or Intel compatible CPU.

What is PC/104 ?

PC/104 is an industrial standard, for PC based systems that can be stacked together in order to create an embedded system. The footprint of theses boards is 4"x4" so as you can see it is a good base in order to start a wearable project.

What about PC/104–plus ?

It is a PCI addition to the PC/104 standard. you can read the [PC–104 FAQ](#)

5.3 Transmeta's processor the Crusoe.

It seems that Transmeta hasn't build the fastest chip on the market but has indeed focused on power saving making its processor an ideal choice for a wearable project, moreover it seems that motherboards will be available very soon as Phoenix Bios released their Bios for this chip.

5.4 Misc

Last year there were some alpha based Multia sold for around \$100, but it seemed AFAIK that nobody ever managed to build a wearable around one of theses devices.

6.Power supply

There is plenty of choice as long as you use batteries. But be careful __NEVER__ use liquid acid filled batteries it is a Health Hazard for this application.

7.OS.

For the people whose Wearable is based on a PDA, there is little choice : most of the time they have to do with the PDA's manufacturer OS, AFAIK Linux on Psion series 5 is not mainstream. a commercial solution called WindStone primary targeted to palmpilots with a project to port it to ARM based computers it is made by [OSK](#), so and see. For [Mips based PDA](#) type; some of them seem to be able to run [NetBSD](#) (it is a member of the *BSD family of unices running on a lot of platforms).

For those using a PC derivative, the choice seems to be between Microsoft products or Linux, Well, Microsoft products are not exactly the best choice and DEBIAN/GNU Linux is the winner (I don't think that for general purposes one has to use a posix .4 compliant kernel).

There is another contender [QNX](#), but is more industrial oriented, so for hobby or research it is not the best choice.

8.The Sulawesi project.

This project deals as well with input modalities and with output modalities thus its section is just before the Input/Output part of this document.

It is meant to accept input from different modalities and to do its input to a number of different modalities, this is written in Java; The good news is that it is highly portable, the bad news is that today a JVM is a memory and resource hog (but, to me, Java and the related technologies such as Jini, just like the wearable, is a stealth menace). One of the nice features of this project is the fact that, because of a clever design, it can deal with with a great input and output modalities that exists today, and when new modalities one hadn't even think about will be available, it should be able to deal with them in a very short time and with little effort.

Today, it can accept input from a GPS too. You can find more information at :

9.Input

9.1 Variations around the keyboard

Mini keyboards

Usually theses devices are on the wearer's forearm or wrist.

The [WristPC](#) Keyboard and the [Arm mount micro keyboard](#) from the Phoenix Group Inc. are typical from this concept.

One hand keyboard.

IMHO it is the best concept because it doesn't require you to look at the keyboard while typing is the less intrusive when you have to deal with other people, and in order to be accepted by other a Wearable wearer's must have the lowest visual signature.

The archetype of this concept is the [Twiddler](#) and all of its clones.

At first using a twiddler may seem to be a little bit confusing. The very first thing to do is to read the manual (don't forget to plug the keyboard or the PS/2 adaptator or your twiddler won't work because it will get no power supply.) The reference card may, at first, seem confusing because when you are working with your twiddler you are behind the buttons and the reference card show you the buttons from the front side not from the rear so you will have to switch right and left. When you have passed these steps you will quickly learn how to use it and IMHO it feels very comfortable to use. The way the integrated mouse operates is very natural too.

10. [Audio Output](#)

When your system doesn't output too much data, or in order to signal some special events an audio output can do the job. Most laptops come with a Sound Blaster compatible sound card and a lot of PC-104 cards are sold with such a sound card on board or you should buy a sound module. The next step is to redirect your text output to a `text_to_speak` program.

As a lot of input is done using emacs, it seems to be a good idea to use [Emacsspeak](#)

11. [Visual Output](#)

11.1 Head Down displays.

Wristwatch type

Commercial Solutions.

Some manufacturers (eg Seiko, Citizen, Casio) manufactured Wristwatches that could be linked to a computer, (I remember that in 1982 Seiko showed a prototype of a wristwatch TV (monochrome LCD)).

[Casio](#) has a broad set of wristwatches, some of them could be described as Wearables that can display time among other things, of interest are the

- The PC Unite that can exchange data with a computer using an infra red link.
- The ATC1200–1V Forester features an electronic compass, plus thermometer and barometer. I used to own one of these it is a great piece of hardware
- The Technowear products have different features including voice recording, IR remote control, Databank...
- The [GPS](#) watch is one of the most intriguing watch I have ever seen

The Wristwatchcomputer.

In 1998 S. Mann displayed a [Wristwatch](#) videoconferencing computer, it runs GNU/Linux and uses an XF86 Server, there is a pinhole video camera on the watch itself. This device is to say the least impressive, some of the software, is [downloadable](#) and GPLed.

It is also possible to use a 4 lines LCD display connected to the serial port of your laptop (numerous paper or online electronics magazine offer schematics).

PDA type

PDA's seem to be a cheap and efficient way of sending and displaying data for a wearable, actually any PDA with a VT100 emulation program and a serial link can be used effectively as a terminal (I have successfully used my HP200LX running [kermit](#)

as a terminal for my desktop, giving me an emergency access to it if the display failed)

11.2 Head UP displays

The distinction between obstrusives an non obstrusives ones is not from the wearer point of view but from the other people, that is is the display forbid to see the wearer's eyes

Obstrusives displays

Hacks with LEDs

Some people managed to use blinking LEDs in order to retrieve information from their device. This is one of the simplest display one can imagine : a LED or a row of LED blinking.

Sony GLASSTRON

Sony sells a device called the Glasstron; in Paris, France the FNAC Montparnasse sells the PVD–V30 glasstron 55 at 13999F (this is about US \$2333).

The M1

[Tekgear](#) manufactures the M1.

The VRD (Virtual Retinal Display)

With this device a manufactured by [Microvison](#) a LASER LED draws the image on the wearer's retina, the US Navy tested it in the summer 1999, at Hawaii (see in the army now).

Nonobstrusives displays

The [Microoptical](#) corporation manufactures two displays the Integrated Eyeglass display and the ClipOn display.

12.[Comms](#)

AFAIK Most of the time it is with a radio link, should it be with a radio transceiver or via a cell phone.

It seems that IBM's [Personal Area Network](#) or the [Bluetooth](#) technology will enable building LANs of Wearables very easily. (actually IBM is also a member of the Bluetooth SIG).

13.[How can I have my Wearable ?](#)

13.1 Commercial Solutions.

Some companies sells Wearables ready to use out of the Box, hereafter is a list of them.

- [Genesys Technology](#) manufactures a Wearable that uses a HMD display.
- [handsfreemobile](#) sells the Mid Riff Brain, it is mostly an LCD touchpad based solution and the unit is in a pouch fixed on the waistband.
- [Teltronics](#) sells the Mentis. It is a modular wearable.
- [Via](#) sells the VIA II PC a Wearable that is worn on the waistband.
- [Xybernaut](#) sells the Mobile Assistant IV (MA IV) available with RedHat Linux 6.1, Suse Linux

,Windows 9x and Windows NT4

13.2 Do it yourself.

As wearable computing is in its very early beginning you should make various experiments and share them with your peers. Doing this with an open and versatile OS such as Linux should give you a lot of fun (after all, desktop computer is just a plain vanilla computer), because you play with both the OS and the hardware. If you are unsure of the technical decisions you are going to make, you can start with a proven design. On the net you can find the specifications of some wearable systems thus you will not have to reinvent the wheel and you will avoid some pitfalls. (the designs are sorted by alphabetical order).

- The [Lizzi](#); it is the MIT's wearable design.
 - In the UK you can find the [Vase Lab Wearable](#) it is from Neil Newman at the University of Essex.
 - In Canada, the [Wearcomp](#) is a proven design, by Prof. Steve Mann at the University of Toronto.
-

[14.PalmPilot and its clone \(IBM, HandSpring, TRG \): a new breed of wearables.](#)

14.1 The palm family.

The PalmPilot family and its clone is a hit among PDAs, but less known is the fact that it is more than a PDA it is one of the first off the shelves wearable. You can connect it to your cell phone, When on the move you may need an input device more convenient than Graffiti: a keyboard for example, one device exists that allow you to plug a PS/2 keyboard in your palm: Happy Hacking cradle Specially for the Palm.

[PFU](#) Happy Hacking sells a PS/2 adapter for the Palm, thus one should be able to hook any PS/2 keyboard on this device. It is battery (2 AA) powered.

It seems that someone has managed to get a twiddler keyboard working with the PalmPilot. If you want to do land navigation it exists an electronic compass you can plug into your palm it is called Palm Navigator and it is manufactured by [Precision Navigation](#) They even sell a weather station.

If you have more money to spend or want more precision you can purchase a GPS receiver called Earthmate; it is manufactured by [Precision Navigation](#) Some of you may want a software only solution: this can be done. If you have some highly specialized needs like commuting without having the subway map and want a readily made solution you can use a program like Route Expert, I use it on a daily basis, it works great with Paris's subway and I will test it with Berlin's subway at the end of the year (of course it exists other programs but this one is the one I am using). I guess everyone can find the North using the sun and a wirtswatch, a PalmPilot can do it with more precision using readymade programs such as T.J's Sun–Compass (once again there exists other programs but this one is the one I am using).

The most important with the PalmPilot for the Linux community is the fact that there exists two ports of

Linux for it (DragonBall is a member of the 68000 family after all). One is GPLed

You can find more information at : [uClinux](#)

the second one is commercial, it is based in Korea. [WindStone](#) it is based on uClinux and it is coming with its own GUI and widgets.

Thus with the next generation of Palms, the CPU speed will be twice today's speed, and with Linux on board we will be able to run a lot of software that are hardware independent and have been written for today's x86 Linux based wearables.

14.2 PDAs runing Linux.

Samsung displayed a PDA named the [Yopi](#) runing Linux. It is an ARMLinux based PDA, 32 MB RAM, featuring a voice recorder, mp3 player, IrDa port, compact flash slot, a 4" color TFT and HandWritting Recognition, plus Serial and USB interface. Word has spread that it should be sold this summer but unti then wait and see.

It exists a [Mips based PDA info Center](#) This site focuses both on NetBSD and LinuxCE on MIPS based PDAs.

You can find some information on the [LinuxCE](#) port; and you may wish to read the [LinuxCE FAQ](#) With theses PDAs one should be able to consider building a nice PDA based Wearable.

15.[How to carry my wearable ?](#)

Depending on your wearable's family (eg Palm, palmtop computer, laptop based, PC/104) there seem to be 3 convenient ways of carrying it around. You can carry it on tour wrist, or in a backpack or you can hang it on your waistband.

16.[Applications with Wearables.](#)

As a rule of thumb the first people who are going to use extensively the wearables are the people whose work is a matter of life and death.

16.1 In the army now.

It is very important in an army to have an edge over the enemy, that is what we have always seen in history, and moreover the army is known to spend vast amount of money in order to get this edge.

Some years ago the infantryman was ordered to carry different pieces of ordnance that came from different sources and were not part of a whole thing, and to try to do his best with these (looks like Frankenstein to me). With these new projects the infantryman is the centerpiece of a coherent, complementary weapons and equipment system.

- Australian Army.

In Australia there is a program called Land 125 Soldier Combat System (formerly "Wundurra" (the aboriginal word for Warrior)), there is some information on [DTSO](#)'s website; and according to the [ATSE](#) this project should be on phase 2 on year 2000/2001.

According to DTSO the soldiers should have intra-section radios, night vision and sighting capability and head up display.

- French Forces.

In France there is a project called FELIN (Fantassin à Equipement et Liaison Intégrées (Foot soldier with integrated equipment and links))

in order to enhance the efficiency of the soldier a set of devices had been developed with very careful limitations : historically the foot soldier has been a beast of burden, thus the FELIN project wishes to limit its load at 25kg. The soldier has got a radio link, a computer and a camera on his weapon (allowing him to open fire from cover). The display is done with a monocular HMD.

- UK Forces.

The FIST (Future Integrated Soldier Technology) project: Early tests were conducted on Salisbury Plain to determine if the soldier could access information either 'Head Up' (in a helmet display), 'Head Down' (on a wrist mounted display), via a palmtop computer or if necessary a map

lessons learned (in L'armement issue 67 September 1999)

- ◆ There is no scope for enhancing soldier performance through the provision of tactical information unless the soldier can access information 'on the move'
- ◆ The preference, both by day and night was the helmet display.

The FIST Digitization Trials will be conducted on Salisbury Plain in June and November 2000. The June trial addresses information flow, the November trial will address the benefits of enhanced information to determine if there is a consequent increase in the 'Tempo of Operation'.

- US Forces

- ◆ The land warrior program

It is a system made of 5 subsystems cooperating together.

Wearable–HOWTO.

- ◇ A Pentium Computer/Radio Subsystem (C/RS) made by Motorola featuring an integrated GPS receiver
- ◇ The Protective Clothing and Individual Equipment Subsystem (PCIE) made by Gentex
- ◇ The Weapon Subsystem (WS) made by Raytheon
- ◇ The Software Subsystem made by Raytheon
- ◇ The Integrated Helmet Assembly Subsystem (IHAS) made by Honeywell

The location of each squad member will be available through the IHAS, as well as digitized maps and tactical information. Every soldier will have an integrated GPS as well as video recording capabilities. Of course the soldier will have night vision capability as well as deported sighting. Tests should take place during year 2000. More info on the Land Warrior program at

<http://www.sbcom.army.mil/programs/lw/index.htm>

(There is even a FAQ and pictures). AFAIK this is going to be the biggest test for the wearable concept because the Army is planning to purchase 34000 units plus spares.

- ◆ The navy.

During the summer 1999 news poured that the US Navy tested the Virtual Retinal Display at Hawaii. The explanation is that there doesn't seem to be enough space in the fighting ships because of the numerous CRT, so it is conceivable for the crew to wear VRDs

Needless to say, that some very low profile and highly specialized units should have adopted the wearable concept but as far as we cannot have evidence we can only speculate on that.

16.2 At the hospital

The [Microvison](#)'s VRD has been [delivered](#) to the Wallace Kettering Neuroscience Institute, Dayton Ohio, for neurosurgery applications. This is not a full featured wearable solution but it is a big step toward the adoption of wearables in health care activity. (on the website you can view a [simulated image](#)).

16.3 With the firefighters

Firefighters are using thermal cameras in order to see through the smoke, in the next years theses devices should be miniaturized and with a wearable firefighters should have both hands free and will have real time access to data such as the map of the building and numerous helpful informations.

16.4 Wearable for the disabled.

One can easily think that a wearable computer can be very helpfull for the disabled people, for example for blind people a wearable with a GPS receiver, some maps of the surroundings and even more, interacting with its surroundings by means of active beacons can be a very good substitute for a dog, the elements exists for a

long time.

This should be easily done : the linux comunity has good text to speech applications, voice recognition is quite ready for this application , the IrDA or Modem radio drivers are OK, the same applies to the GPS programs, we have to develop an electronic blind walking stick in order to detect the obstacles at a much reater range and last, but not the least to convince the authorities.

17.A borg's life.

This section deals with Human–Human interaction. As the wearable is quite new for the layman one has to expect some strange reactions from the other people. When I go out and read my PalmPilot's screen while walking or in the subway people have one of the following reactions :

- No reaction: because they are in their own world or because they don't care.
- Curiosity: they come to me and ask me questions like "what it is", "what are you doing with it" and "how much does it cost ?"
- Disdain : they may think I want to draw attention.
- Hostility/Fear : "this guy is nut: avoid him".

Steve Mann Gave an interview in the New Scientist magazine and as he was one of the first to test the waters, so he has a long experience in this field. The second problem is that the wearable's hardware is quite expensive and some predators will spot a new device that can be easily stolen and sold at a good price, or just in order to have one of them. As a conclusion you have to be very cautious.

18.Sources of Information.

18.1 Non commercial

A good starting point to gather information is to subscribe to the wear–hard@haven.org mailing list, you have to send a message with the word subscribe in the subject to wear–hard–request@haven.org.

The archive of this mailing list is mirrored at [Wearable Central](#) This site was founded to be an archive center for the mailing list and the newsgroup. It is maintained by R. Paul McCarty.

You can also read one of the very good FAQs such as the [wearcompfaq](#) or you may go to the [wearable webring](#) (at the time of this writting the webring lists 35 sites).

18.2 Commercial.

You can find information on the web sites of the company cited in the various sections of this document and as stated earlier in this document : The companies quoted here are just for your information only, I do not endorse any of their product, this just in order to help you.

18.3 Reading.

Some science fiction books can be a good introduction to Wearable computing. Among other books one can think of (alphabetical listing):

- Diamond Age by Neal Stephenson (a lot of nanotechnology too).
 - Snow Crash by Neal Stephenson
 - Virtual Light by Willian Gibson
-

19.[To do List.](#)

This section is about things that have to be done for the next releases if you wish to contribute it is a good place to look at.

- To review more in depth the sulawesi project.
 - Organic Leds are very interesting, I should cover theses too.
 - To expand the input/visual output sections.
 - To expand and reorder the advocacy section.
 - To have an "in the car" section.
 - The concept of an UW wearable seems viable lets think about it.
 - List and describe all projects.
 - List and describe all products.
 - To get some sleep ;-).
-

20.[Revision History.](#)

- v 0.0.7 March 2000, second release.
 - v 0.0.5 December 1999, first release.
 - v 0.0.1 November 1999, first draft.
-

21.Thanks and Credits.

I would like to thank among other people:

- Werner Heuser <wehe@snafu.de> for the work he has done maintaining his [Laptop-HOWTO](#)
 - The people of the Wearable mailing list which proved to be very informative and open minded.
 - My friend Manu Coutris for his never ending patience and kindness.
 - The people of the Wearable community whose discussion and web sites strengthen my confidence in the wearable concept.
 - Professor Steve Mann for his patience and for beeing one of the pionners in the Wearable Computing field. I also wish to thank him for the wearcompdef, wearcompfaq and wristwatch wearable links.
-
